# CHAPTER 1. INTRODUCTION

## Contents and Audience

This manual describes the router DSL-224 and explains how to configure and operate it.

This manual is intended for users familiar with basic networking concepts, who create an in-home local area network, and system administrators, who install and configure networks in offices.

## Conventions

| Example  | Description   |
|--|---|
| text   | The body text of the manual.  |
| <i>Before You Begin</i>  | A reference to a chapter or section of this manual.                                   |
| <i>“Quick Installation Guide”</i>  | A reference to a document.  |
| <b>Change</b>  | A name of a menu, menu item, control (field, checkbox, drop-down list, button, etc.). |
| <b>192.168.1.1</b>   | Data that you should enter in the specified field.                                    |
|  <u>Information</u> | An important note.  |

## Document Structure

*Chapter 1* describes the purpose and structure of the document.

*Chapter 2* gives an overview of the router's hardware and software features and describes its appearance and the package contents.

*Chapter 3* explains how to install the wireless router DSL-224 and configure a PC in order to access its web-based interface.

*Chapter 4* describes all pages of the web-based interface in detail.

*Chapter 5* includes safety instructions and tips for networking.

*Chapter 6* introduces abbreviations and acronyms used in this manual.

## CHAPTER 2. OVERVIEW

### ***General Information***

DSL-224 is an affordable high-end VDSL/ADSL router with Wi-Fi and built-in switch.

The router is equipped with a DSL port to connect to a high-speed VDSL line and 4 Ethernet ports to connect workstations. Due to this feature, DSL-224 represents a moderate-priced solution for creating wired networks without an additional switch. In addition, any Ethernet port of the device can be used to connect to a private Ethernet line.

DSL-224 can operate as a base station for connecting wireless devices of the standards 802.11b, 802.11g, and 802.11n. The router supports multiple functions for the wireless interface: several security standards (WEP, WPA/WPA2), MAC address filtering, WPS, WMM.

In addition, the device is equipped with a button for switching the Wi-Fi network off/on. If needed, for example, when you leave home, you can easily switch the router's WLAN by pressing the button, and devices connected to the LAN ports of the router will stay online.

Support of guest Wi-Fi network allows you to create a separate wireless network with individual security settings and maximum rate limitation. Devices connected to the guest network will be able to access the Internet, but will be isolated from the devices and resources of the router's LAN.

The wireless router DSL-224 includes a built-in firewall. The advanced security functions minimize threats of hacker attacks, prevent unwanted intrusions to your network, and block access to unwanted websites for users of your LAN.

Built-in Yandex.DNS service protects against malicious and fraudulent web sites and helps to block access to adult content on children's devices.

You can configure and manage the settings of the wireless router DSL-224 via the user-friendly web-based interface (the interface is available in several languages).

The fast and easy configuration wizard allows you to specify all needed parameters in several simple steps.

Also DSL-224 supports configuration and management via mobile application for Android and iPhone smartphones.

You can simply update the firmware: the router itself finds approved firmware on D-Link update server and notifies when ready to install it.

## Specifications\*

| Hardware               |   |

## ***Delivery Package***

The following should be included:

- Router DSL-224
- Power adapter DC 12V/1A
- RJ-11 telephone cable
- Ethernet cable
- Splitter
- “***Quick Installation Guide***” (brochure).

The “***User Manual***” and “***Quick Installation Guide***” documents are available on D-Link website (see [www.dlink.ru](http://www.dlink.ru)).

 Using a power supply with a different voltage rating than the one included will cause damage and void the warranty for this product.

## CHAPTER 3. INSTALLATION AND CONNECTION

### ***Before You Begin***

Please, read this manual prior to installing the device. Make sure that you have all the necessary information and equipment.

#### **Operating System**

Configuration of the VDSL/ADSL router DSL-224 with Wi-Fi and built-in switch (hereinafter referred to as “the router”) is performed via the built-in web-based interface. The web-based interface is available from any operating system that supports a web browser.

#### **Web Browser**

The following web browsers are recommended:

- Apple Safari 8 and later
- Google Chrome 48 and later
- Microsoft Internet Explorer 10 and later
- Microsoft Edge 20.10240 and later
- Mozilla Firefox 44 and later
- Opera 35 and later.

For successful operation, JavaScript should be enabled on the web browser. Make sure that JavaScript has not been disabled by other software (such as virus protection or web user security packages) running on your computer.

#### **Wired or Wireless NIC (Ethernet or Wi-Fi Adapter)**

Any computer that uses the router should be equipped with an Ethernet or Wi-Fi adapter (NIC). If your computer is not equipped with such a device, install an Ethernet or Wi-Fi adapter prior to using the router.

#### **Wireless Connection**

Wireless workstations from your network should be equipped with a wireless 802.11b, g, or n NIC (Wi-Fi adapter). In addition, you should specify the values of SSID, channel number and security settings defined in the web-based interface of the router for all these wireless workstations.

## Connecting to PC

### PC with Ethernet Adapter

1. Connect an Ethernet cable between any of LAN ports located on the back panel of the router and the Ethernet port of your PC.
2. **To connect the device to a DSL line:** connect a phone cable between the DSL port of the router and the **MODEM** port of the splitter. Connect your phone to the **PHONE** port of the splitter. Then connect another phone cable between a phone jack and the **LINE** port of the splitter.
3. **To connect the device to an Ethernet line:** please connect the router to the ISP's Ethernet line only after setting the WAN port and creating the Internet connection (see the **Initial Configuration Wizard** section, page 31).
4. Connect the power cord to the power connector port on the back panel of the router, then plug the power adapter into an electrical outlet or power strip.
5. Turn on the router by pressing the **ON/OFF** button on the back panel.

Then make sure that your PC is configured to obtain an IP address automatically (as DHCP client).

## Obtaining IP Address Automatically (OS Windows 7)

1. Click the **Start** button and proceed to the **Control Panel** window.
2. Select the **Network and Sharing Center** section. (If the Control Panel has the category view (the **Category** value is selected from the **View by** drop-down list in the top right corner of the window), choose the **View network status and tasks** line under the **Network and Internet** section.)

Figure 4. The **Control Panel** window.

3. In the menu located on the left part of the window, select the **Change adapter settings** line.

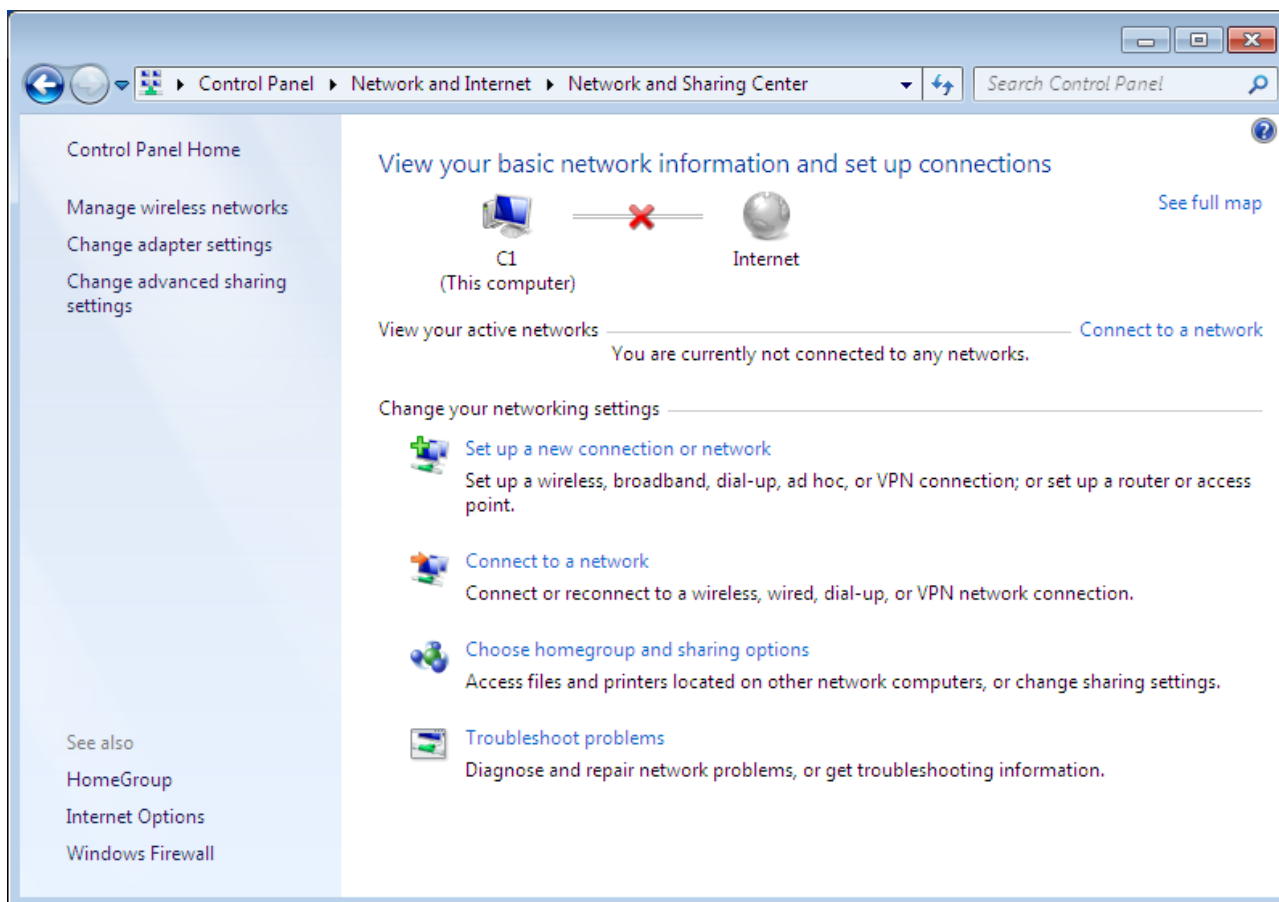

Figure 5. The **Network and Sharing Center** window.

4. In the opened window, right-click the relevant **Local Area Connection** icon and select the **Properties** line in the menu displayed.

Figure 6. The **Network Connections** window.

5. In the **Local Area Connection Properties** window, on the **Networking** tab, select the **Internet Protocol Version 4 (TCP/IPv4)** line. Click the **Properties** button.

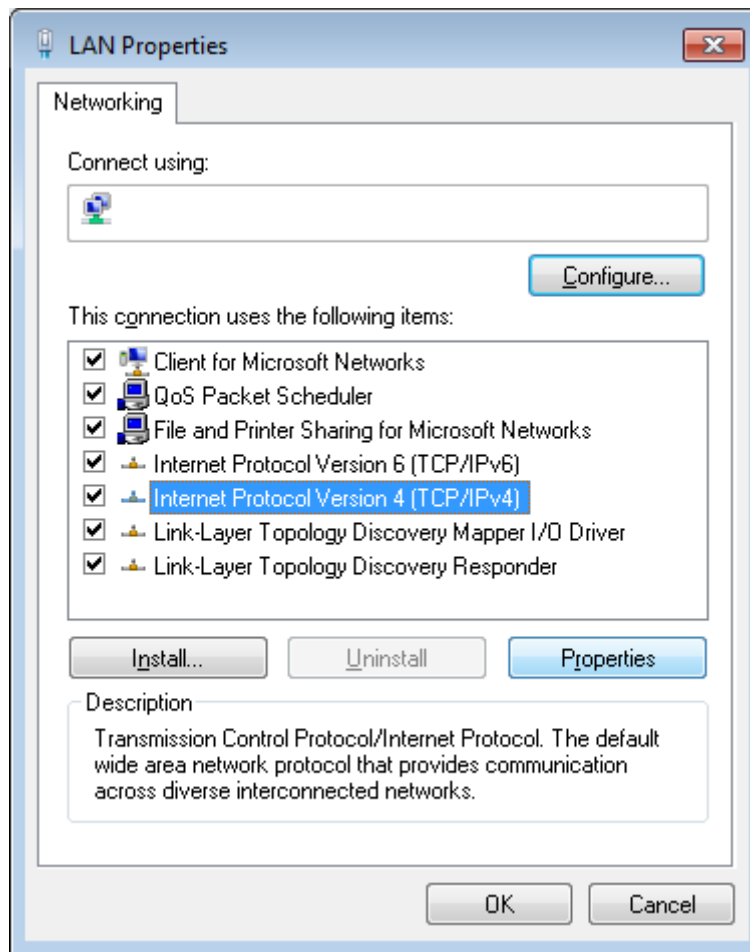

Figure 7. The **Local Area Connection Properties** window.

6. Make sure that the **Obtain an IP address automatically** and **Obtain DNS server address automatically** choices of the radio buttons are selected. Click the **OK** button.

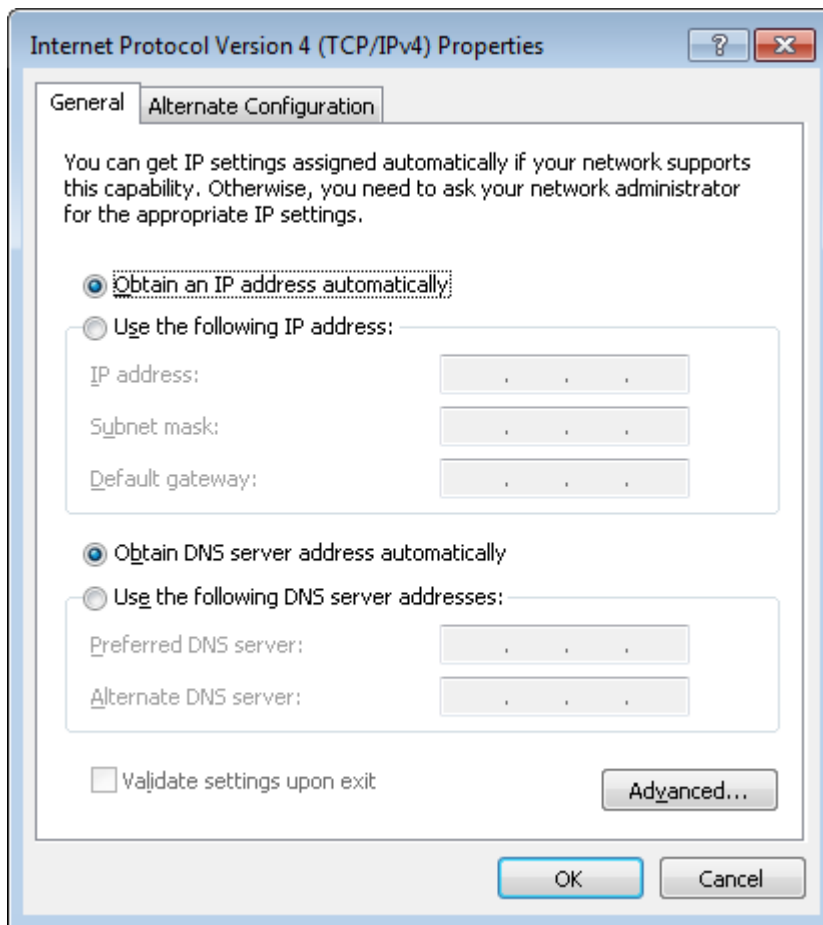

Figure 8. The **Internet Protocol Version 4 (TCP/IPv4) Properties** window.

7. Click the **OK** button in the connection properties window.

## PC with Wi-Fi Adapter

1. *To connect the device to a DSL line:* connect a phone cable between the DSL port of the router and the **MODEM** port of the splitter. Connect your phone to the **PHONE** port of the splitter. Then connect another phone cable between a phone jack and the **LINE** port of the splitter.
2. *To connect the device to an Ethernet line:* please connect the router to the ISP's Ethernet line only after setting the WAN port and creating the Internet connection (see the *Initial Configuration Wizard* section, page 31).
3. Connect the power cord to the power connector port on the back panel of the router, then plug the power adapter into an electrical outlet or power strip.
4. Turn on the router by pressing the **ON/OFF** button on its back panel.
5. Make sure that your Wi-Fi adapter is on. As a rule, modern notebooks with built-in wireless NICs are equipped with a button or switch that turns on/off the wireless adapter (refer to your PC documents). If your PC is equipped with a pluggable wireless NIC, install the software provided with your Wi-Fi adapter.

Then make sure that your Wi-Fi adapter is configured to obtain an IP address automatically (as DHCP client).

## Obtaining IP Address Automatically and Connecting to Wireless Network (OS Windows 7)

1. Click the **Start** button and proceed to the **Control Panel** window.
2. Select the **Network and Sharing Center** section. (If the Control Panel has the category view (the **Category** value is selected from the **View by** drop-down list in the top right corner of the window), choose the **View network status and tasks** line under the **Network and Internet** section.)

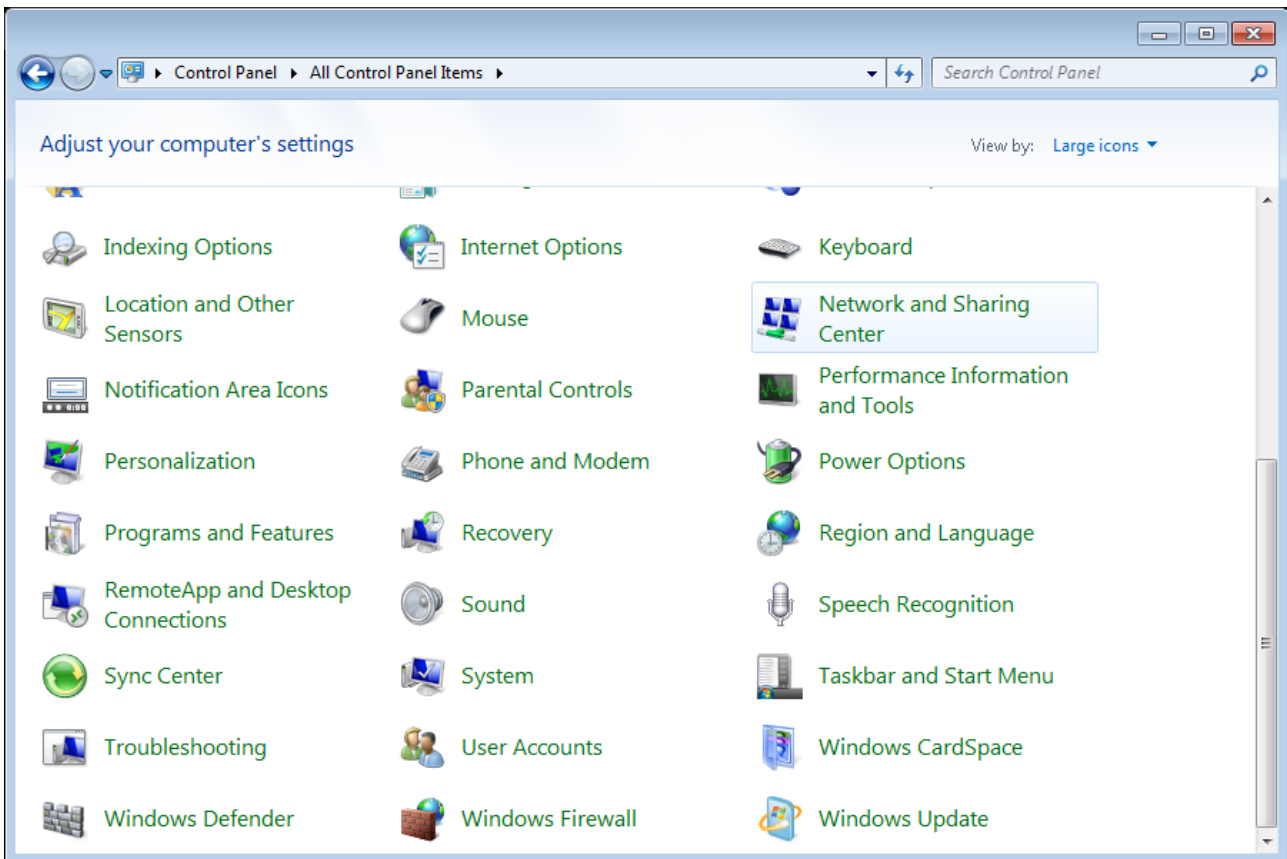

Figure 9. The **Control Panel** window.

3. In the menu located on the left part of the window, select the **Change adapter settings** line.
4. In the opened window, right-click the relevant **Wireless Network Connection** icon. Make sure that your Wi-Fi adapter is on, then select the **Properties** line in the menu displayed.
5. In the **Wireless Network Connection Properties** window, on the **Networking** tab, select the **Internet Protocol Version 4 (TCP/IPv4)** line. Click the **Properties** button.

6. Make sure that the **Obtain an IP address automatically** and **Obtain DNS server address automatically** choices of the radio buttons are selected. Click the **OK** button.

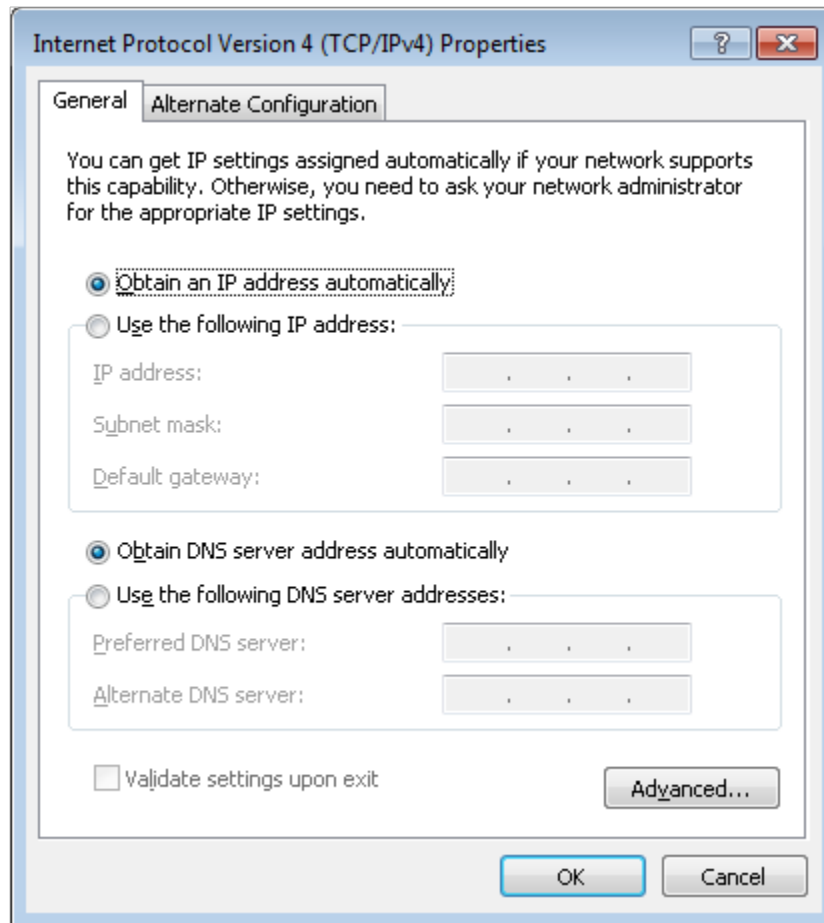

Figure 10. The **Internet Protocol Version 4 (TCP/IPv4) Properties** window.

7. Click the **OK** button in the connection properties window.
8. To activate the WPS function, press the **WPS** button of the router and release. The **WPS** LED will start blinking.
9. To open the list of available wireless networks, select the icon of the wireless network connection and click the **Connect To** button or left-click the network icon in the notification area located on the right side of the taskbar.

Figure 11. The notification area of the taskbar.

10. In the opened window, in the list of available wireless networks, select the wireless network **DSL-224** and click the **Connect** button.

Figure 12. The list of available networks.

11. Then the window for entering the network key will open. Press the **WPS** button of the router again and release.

Figure 13. The window for entering the network key.

12. Wait for about 20-30 seconds. After the connection is established, the network icon will be displayed as the signal level scale.

**!** If you perform initial configuration of the router via Wi-Fi connection, note that immediately after changing the wireless default settings of the router you will need to reconfigure the wireless connection using the newly specified settings.

## Connecting to Web-based Interface

When you have configured your computer, you can access the web-based interface and configure needed parameters (create a WAN connection, change the parameters of the wireless network, specify the settings of the firewall, etc.)

Start a web browser (see the *Before You Begin* section, page 13). In the address bar of the web browser, enter the domain name of the router (by default, **dlinkrouter.local**) with a dot at the end and press the **Enter** key. Also you can enter the IP address of the device (by default, **192.168.1.1**).

Figure 14. Connecting to the web-based interface of the DSL-224 device.

If the error “The page cannot be displayed” (or “Unable to display the page”/“Could not connect to remote server”) occurs upon connecting to the web-based interface of the router, make sure that you have properly connected the router to your computer.

If the device has not been configured previously or the default settings have been restored, after access to the web-based interface the Initial Configuration Wizard opens (see the *Initial Configuration Wizard* section, page 31).

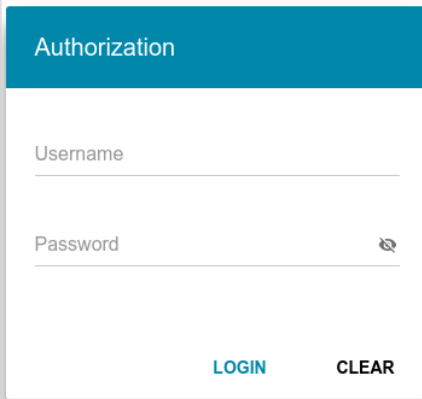

Figure 15. The page for running the Initial Configuration Wizard.

If you configured the device previously, after access to the web-based interface the login page opens. Enter the username (**admin**) in the **Username** field and the password you specified in the **Password** field, then click the **LOGIN** button.

The image shows a web-based login interface. At the top, there is a teal header bar with the text "Authorization" in white. Below the header, the page is white. There are two input fields: "Username" and "Password". The "Username" field is a simple text input. The "Password" field is a text input with a small eye icon to its right, indicating a toggle for password visibility. At the bottom of the form, there are two buttons: "LOGIN" in teal text and "CLEAR" in black text.

Figure 16. The login page.

## Web-based Interface Structure

### Summary Page

On the **Summary** page, detailed information on the device state is displayed.

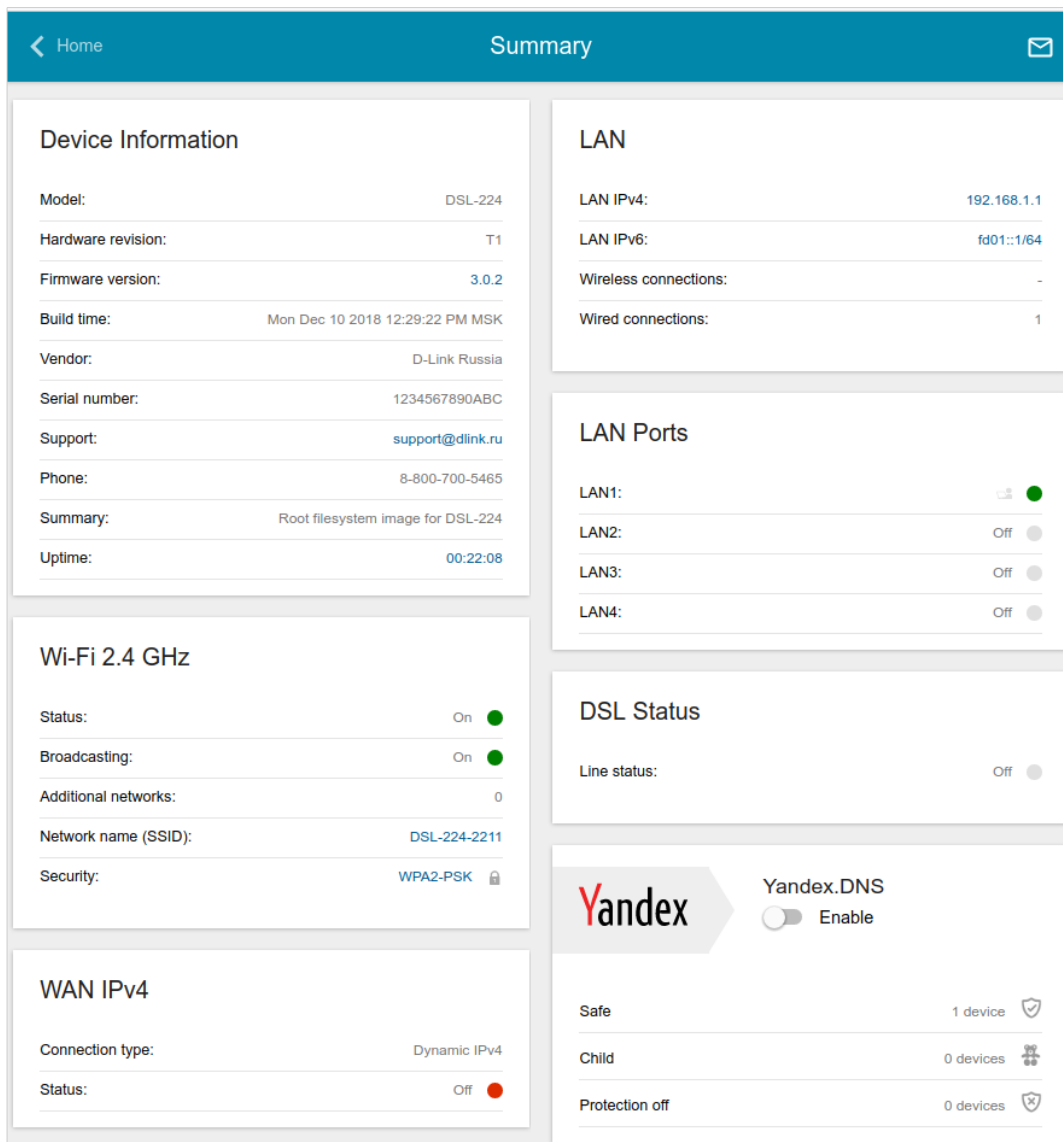

Figure 17. The summary page.

The **Device Information** section displays the model and hardware version of the router, the firmware version, and other data.

To contact the technical support group (to send an e-mail), left-click the support e-mail address. After clicking the line, the e-mail client window for sending a new letter to the specified address opens.

The **Wi-Fi 2.4 GHz** section displays data on the state of the device's wireless network, its name and the authentication type, and availability of an additional wireless network.

In the **WAN** section, data on the type and status of the existing WAN connection are displayed.

In the **LAN** section, the IPv4 and IPv6 address of the router and the number of wired and wireless clients of the device are displayed.

The **LAN Ports** section displays the state of the device's LAN ports.

In the **DSL Status** section, data on the DSL connection state is displayed.

The **Yandex.DNS** section displays the Yandex.DNS service state and operation mode. To enable the Yandex.DNS service, move the **Enable** switch to the right. If needed, change the operation mode of the service.

## Home Page

The **Home** page displays links to the most frequently used pages with device's settings.

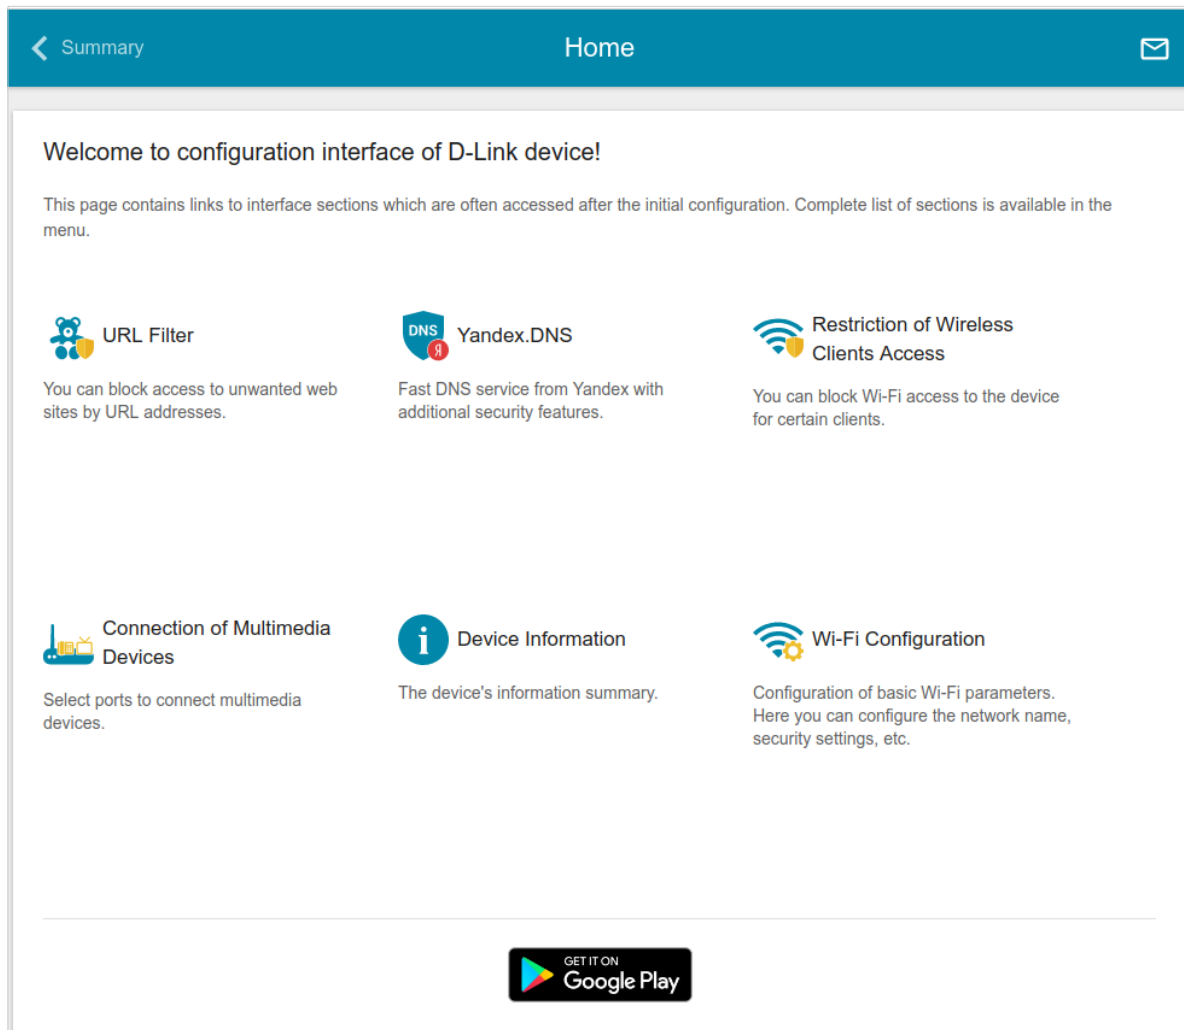

Figure 18. The **Home** page.

Other settings of the router are available in the menu in the left part of the page.

## Menu Sections

To configure the router use the menu in the left part of the page.

In the **Initial Configuration** section you can run the Initial Configuration Wizard. The Wizard allows you to configure the router for operation in the needed mode and specify all parameters necessary for getting started (for the description of the Wizard, see the *Initial Configuration Wizard* section, page 31).

The pages of the **Statistics** section display data on the current state of the router (for the description of the pages, see the *Statistics* section, page 49).

The pages of the **Connections Setup** section are designed for configuring basic parameters of the LAN interface of the router and creating a connection to the Internet (for the description of the pages, see the *Connections Setup* section, page 55).

The pages of the **Wi-Fi** section are designed for specifying all needed settings of the router's wireless network (for the description of the pages, see the *Wi-Fi* section, page 105).

The pages of the **Advanced** section are designed for configuring additional parameters of the router (for the description of the pages, see the *Advanced* section, page 125).

The pages of the **Firewall** section are designed for configuring the firewall of the router (for the description of the pages, see the *Firewall* section, page 144).

The pages of the **System** section provide functions for managing the internal system of the router (for the description of the pages, see the *System* section, page 155).

The pages of the **Yandex.DNS** section are designed for configuring the Yandex.DNS web content filtering service (for the description of the pages, see the *Yandex.DNS* section, page 170).

To exit the web-based interface, click the **Logout** line of the menu.

## Notifications

The router's web-based interface displays notifications in the top right part of the page.

*Figure 19. The web-based interface notifications.*

Click the icon displaying the number of notifications to view the complete list and click the relevant button.

## CHAPTER 4. CONFIGURING VIA WEB-BASED INTERFACE

### *Initial Configuration Wizard*

To start the Initial Configuration Wizard, go to the **Initial Configuration** section. On the opened page, click the **OK** button and wait until the factory default settings are restored.

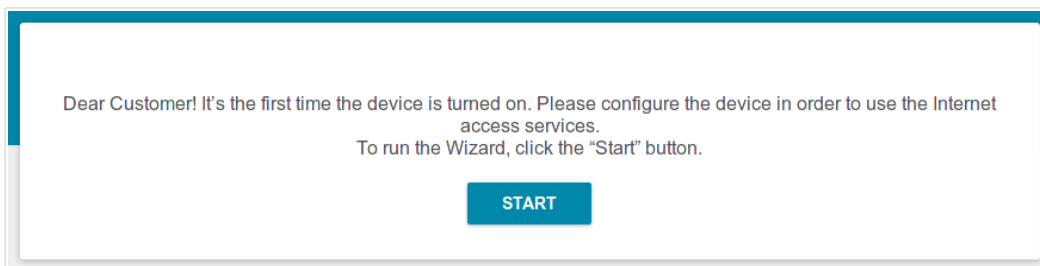

*Figure 20. Restoring the default settings in the Wizard.*

If you perform initial configuration of the router via Wi-Fi connection, please make sure that you are connected to the wireless network of DSL-224 and click the **NEXT** button.

*Figure 21. Checking connection to the wireless network.*

Click the **START** button.

*Figure 22. Starting the Wizard.*

On the opened page, click **YES** in order to leave the current language of the web-based interface or click **NO** to select another language.

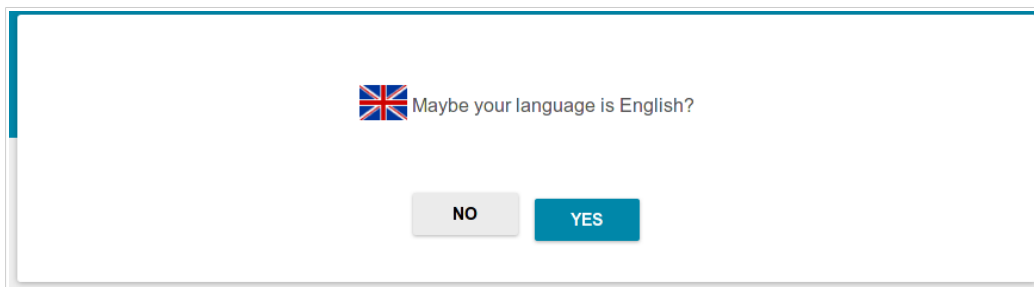

Figure 23. Selecting a language.

You can finish the wizard earlier and go to the menu of the web-based interface. To do this, click the **ADVANCED SETTINGS** button. On the opened page, change the default settings: specify the administrator password in the **Admin password** and **Password confirmation** fields and the name of the wireless network in the **Network name (SSID)** field. Then click the **APPLY** button.

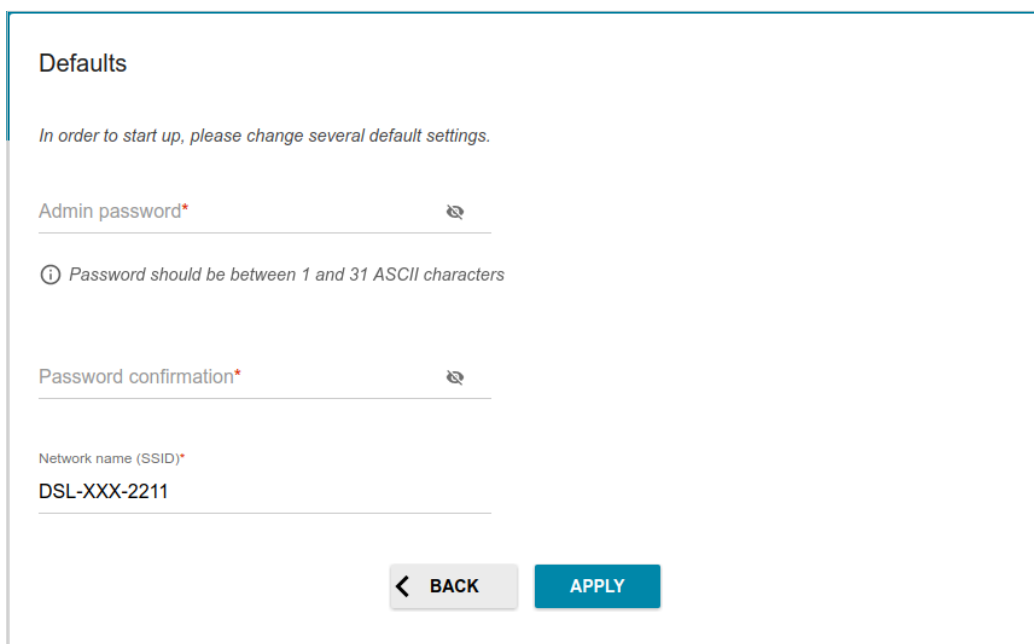

Figure 24. Changing the default settings.

To continue the configuration of the router via the Wizard, click the **CONTINUE** button.

## Selecting Operation Mode

In order to connect your device to a VDSL or ADSL line, on the **Device mode** page, from the **Connection method** list, select the **VDSL** or **ADSL** value correspondingly. In this mode you can configure a WAN connection, set your own settings for the wireless network, configure LAN ports to connect an STB or VoIP phone, and set your own password for access to the web-based interface of the device.

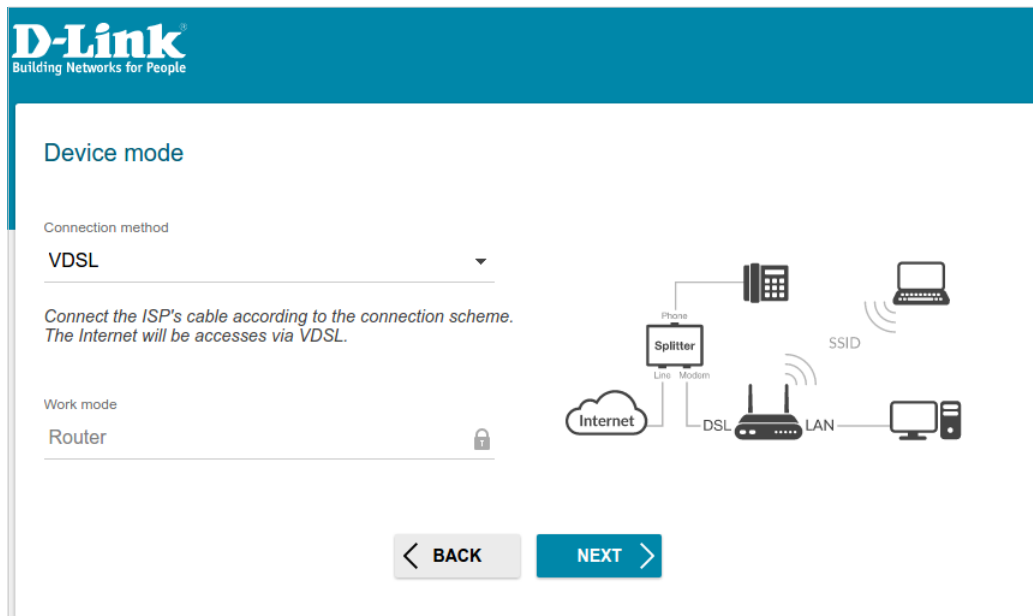

Figure 25. Selecting an operation mode. The **VDSL** connection method.

In order to connect your device to a private Ethernet line, on the **Device mode** page, from the **Connection method** list, select the **Ethernet (LAN)** value. In this mode you can configure one of the router's LAN port as the WAN port, configure a WAN connection, set your own settings for the wireless network, configure LAN ports to connect an STB or VoIP phone, and set your own password for access to the web-based interface of the device.

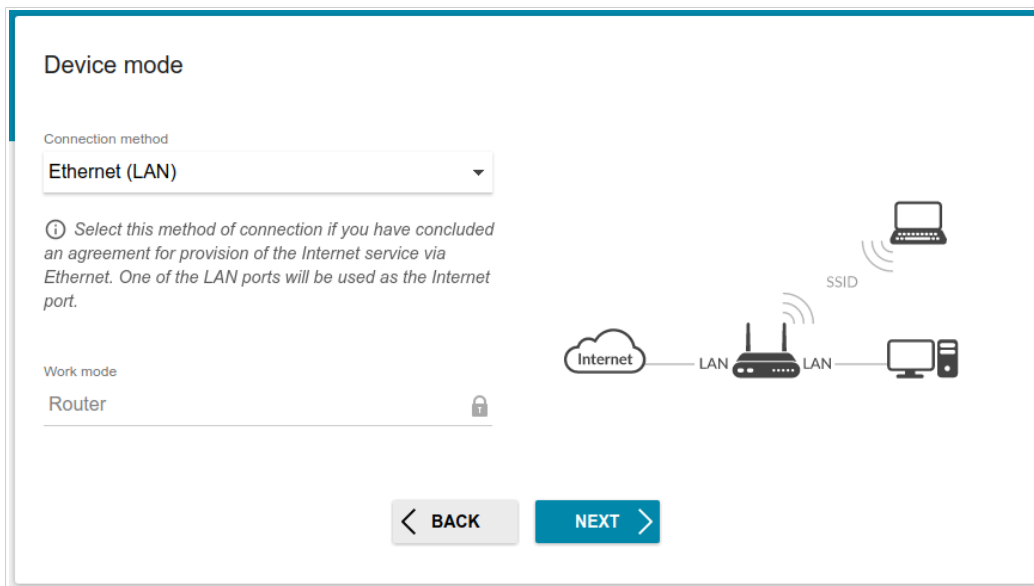

Figure 26. Selecting an operation mode. The **Ethernet (LAN)** connection method.

When the operation mode is selected, click the **NEXT** button.

## Configuring LAN Port as WAN Port

This configuration step is available for the **Ethernet (LAN)** mode.

1. On the **Device connection** page, select a free LAN port which will be used as the WAN port.

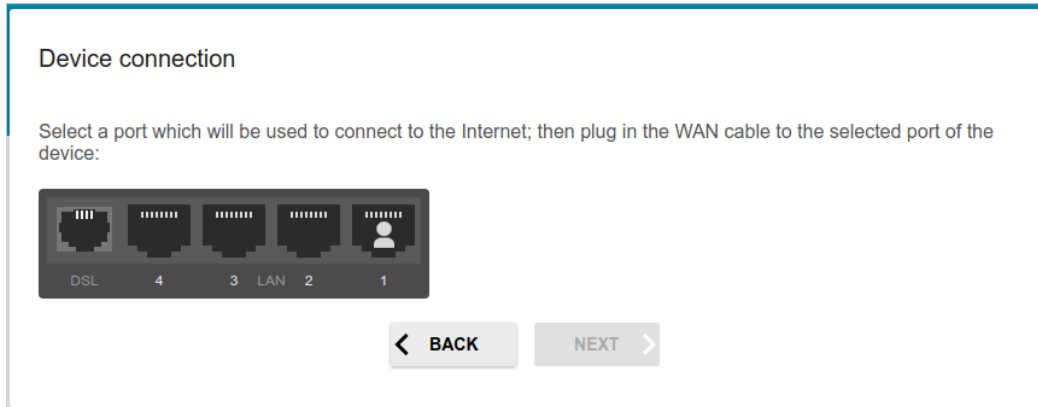

Figure 27. The page for configuring a LAN port as the WAN port.

2. Click the **NEXT** button to continue or click the **BACK** button to return to the previous page.

## Creating WAN Connection

You should configure your WAN connection in accordance with data provided by your Internet service provider (ISP). Make sure that you have obtained all necessary information prior to configuring your connection. Otherwise contact your ISP.

1. On the **Internet connection type** page, from the **Connection type** list, select the connection type used by your ISP and fill in the fields displayed on the page.
2. Specify the settings necessary for the connection of the selected type.
3. *For the **VDSL, Ethernet (LAN)** modes:* If your ISP uses MAC address binding, select the **Clone MAC address of your device** checkbox.
4. *For the **VDSL, Ethernet (LAN)** modes:* If the Internet access is provided via a VLAN channel, select the **Use VLAN** checkbox and fill in the **VLAN ID** field.
5. *For the **ADSL** mode:* Specify the VPI and VCI values in the relevant fields.
6. Click the **NEXT** button to continue or click the **BACK** button to return to the previous page.

## Static IPv4 or IPoA Connection

The screenshot shows a web-based configuration interface for a Static IPv4 WAN connection. The page is titled "Internet connection type" and features a dropdown menu for "Connection type" set to "Static IPv4". Below this, there is an informational icon and text: "A connection of this type allows you to use a fixed IP address provided by your ISP." The form includes four required text input fields: "IP address\*", "Subnet mask\*", "Gateway IP address\*", and "DNS IP address\*". There are two checkboxes: "Clone MAC address of your device" and "Use VLAN", each with an informational icon and explanatory text. The "Use VLAN" text states: "Select the checkbox if the Internet access is provided via a VLAN channel." At the bottom, there are two buttons: a grey "BACK" button with a left arrow and a blue "NEXT" button with a right arrow.

Figure 28. The page for configuring Static IPv4 WAN connection.

The **IPoA** connection type is available for the **ADSL** mode only.

Fill in the following fields: **IP address**, **Subnet mask**, **Gateway IP address**, and **DNS IP address**.

## Static IPv6 Connection

Internet connection type

Connection type  
Static IPv6

*ⓘ A connection of this type allows you to use a fixed IP address provided by your ISP.*

IP address\*

Prefix\*

Gateway IP address\*

DNS IP address\*

Clone MAC address of your device

*ⓘ In some ISP's networks, it is required to register a certain MAC address in order to get access to the Internet.*

Use VLAN

*ⓘ Select the checkbox if the Internet access is provided via a VLAN channel.*

[← BACK](#) [NEXT →](#)

Figure 29. The page for configuring Static IPv6 WAN connection.

Fill in the following fields: **IP address**, **Prefix**, **Gateway IP address**, and **DNS IP address**.

## PPPoE, PPPoA, IPv6 PPPoE, PPPoE Dual Stack Connections

The screenshot shows a web-based configuration interface for setting up an Internet connection. The title is "Internet connection type". Below the title is a dropdown menu labeled "Connection type" with "PPPoE" selected. An information icon (i) is followed by the text "A connection of this type requires a user name and password." Below this is a checkbox labeled "Without authorization". There are two text input fields: "Username\*" and "Password\*", with a "Show" icon (eye) next to the password field. Below these is another text input field labeled "Service name". At the bottom, there are two checkboxes: "Clone MAC address of your device" and "Use VLAN". An information icon (i) is followed by the text "In some ISP's networks, it is required to register a certain MAC address in order to get access to the Internet." Below the "Use VLAN" checkbox is another information icon (i) followed by the text "Select the checkbox if the Internet access is provided via a VLAN channel." At the very bottom are two buttons: "BACK" with a left arrow and "NEXT" with a right arrow.

Figure 30. The page for configuring PPPoE WAN connection.

The **PPPoA** connection type is available for the **ADSL** mode only.

In the **Username** field enter the login and in the **Password** field enter the password provided by your ISP. Click the **Show** icon (👁) to display the entered password. If authorization is not required, select the **Without authorization** checkbox.

## Configuring Wireless Network

1. On the **Wireless Network 2.4 GHz** page, in the **Network name** field, specify your own name for the wireless network or leave the value suggested by the router.
2. In the **Password** field, specify your own password for access to the wireless network.
3. You can restore the parameters of the wireless network specified before resetting to factory defaults. To do this, click the **RESTORE** button.

Figure 31. The page for configuring the wireless network.

4. If you want to create an additional wireless network isolated from your LAN, select the **Enable guest network** checkbox.

Figure 32. The page for configuring the wireless network.

5. In the **Network name** field, specify your own name for the guest wireless network or leave the value suggested by the router.

6. If you want to create a password for access to the guest wireless network, deselect the **Open network** checkbox and fill in the **Password** field.
7. If you want to limit the bandwidth of the guest wireless network, select the **Enable shaping** checkbox and fill in the **Shaping** field.
8. Click the **NEXT** button to continue or click the **BACK** button to specify other settings.

## Configuring LAN Ports for IPTV/VoIP

1. On the **IPTV** page, select the **Is an STB connected to the device** checkbox.

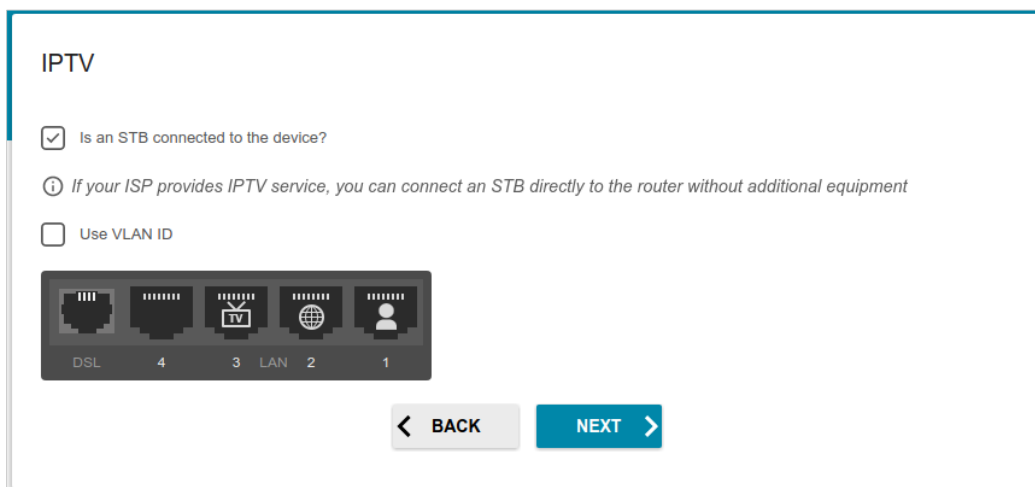

Figure 33. The page for selecting a LAN port to connect an IPTV set-top box.

2. Select a free LAN port for connecting your set-top box.
3. For the **VDSL, Ethernet (LAN) modes**: If the IPTV service is provided via a VLAN channel, select the **Use VLAN ID** checkbox and fill in the **VLAN ID** field.
4. For the **ADSL mode**: Specify the VPI and VCI values in the relevant fields.
5. Click the **NEXT** button to continue or click the **BACK** button to specify other settings.

6. On the **VoIP** page, select the **Is an IP phone connected to the device** checkbox.

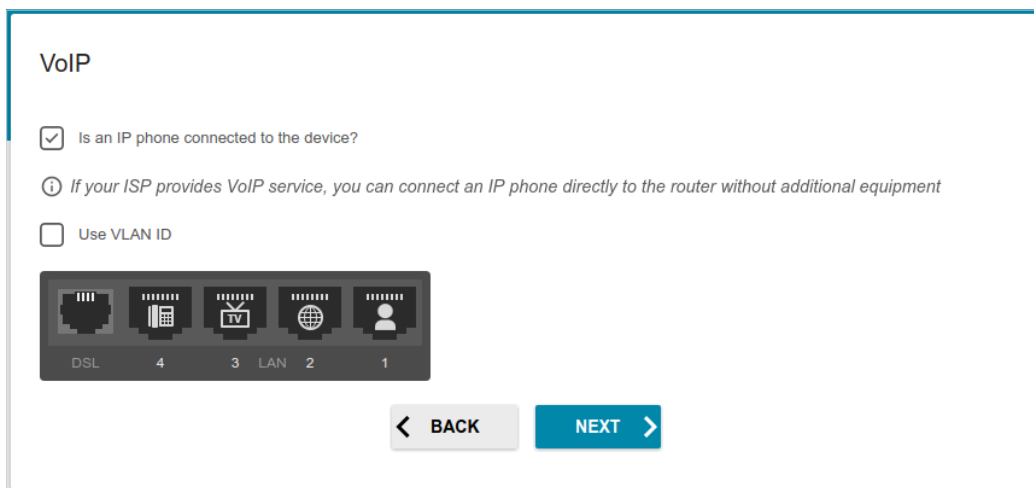

Figure 34. The page for selecting a LAN port to connect an VoIP phone.

7. Select a free LAN port for connecting your IP phone.
8. For the **VDSL, Ethernet (LAN)** modes: If the VoIP service is provided via a VLAN channel, select the **Use VLAN ID** checkbox and fill in the **VLAN ID** field.
9. For the **ADSL** mode: Specify the VPI and VCI values in the relevant fields.
10. Click the **NEXT** button to continue or click the **BACK** button to specify other settings.

## Changing Web-based Interface Password

On this page, you should change the default administrator password. To do this, enter a new password in the **Admin password** and **Password confirmation** fields. You may set any password except **admin**. Use digits, Latin letters (uppercase and/or lowercase), and other characters available in the US keyboard layout.<sup>1</sup>

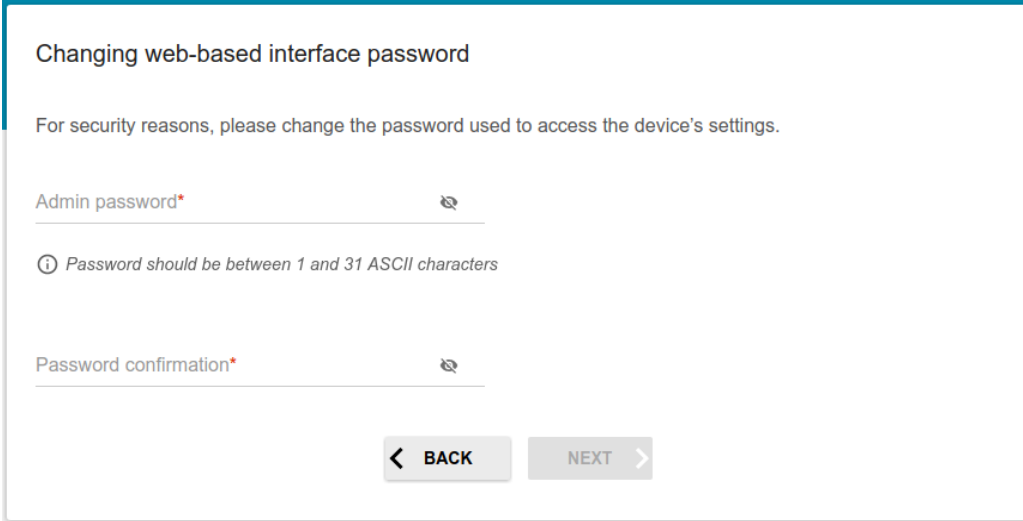

Figure 35. The page for changing the web-based interface password.

Remember or write down the new password for the administrator account. In case of losing the new password, you can access the settings of the router only after restoring the factory default settings via the hardware **RESET** button. This procedure wipes out all settings that you have configured for your router.

Click the **NEXT** button to continue or click the **BACK** button to return to the previous page.

On the next page, check all specified settings.

Also you can save a text file with parameters set by the Wizard to your PC. To do this, click the **SAVE CONFIGURATION FILE** button and follow the dialog box appeared.

To finish the Wizard, click the **APPLY** button. The router will apply settings and reboot. Click the **BACK** button to specify other settings.

<sup>1</sup> 0-9, A-Z, a-z, space, !"#%&'()\*+,-./:;<=>?@[\\]^\_`{|}~.

## Connection of Multimedia Devices

The Multimedia Devices Connection Wizard helps to configure LAN ports or available wireless interfaces of the router for connecting additional devices, for example, an IPTV set-top box or IP phone. Contact your ISP to clarify if you need to configure DSL-224 in order to use these devices.

To start the Wizard, on the **Home** page, select the **Connection of Multimedia Devices** section.

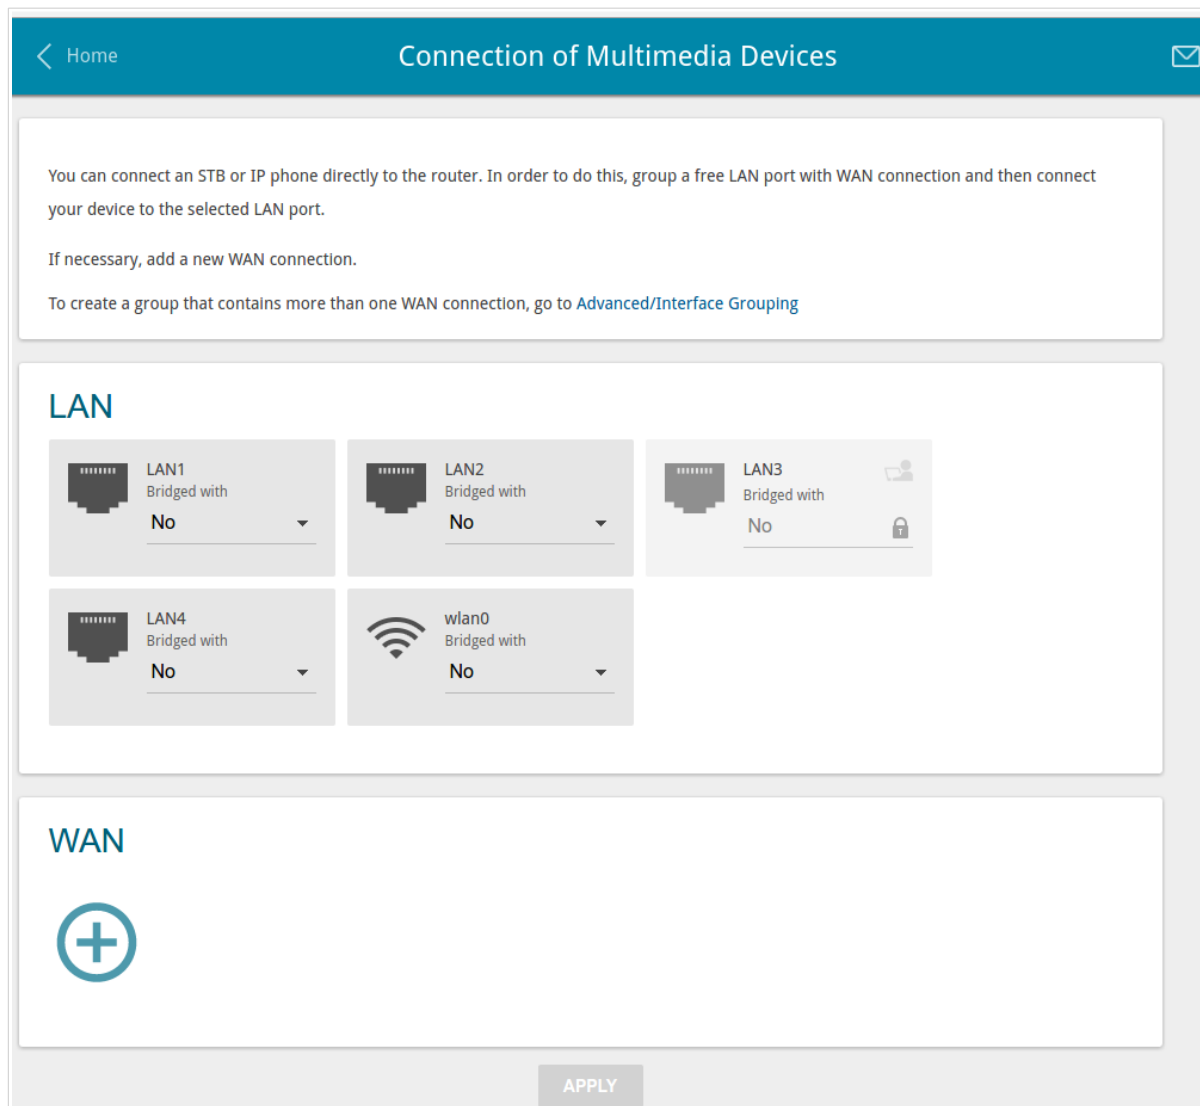

Figure 36. The Multimedia Devices Connection Wizard.

In the **WAN** section, click the **Add** icon (  ).

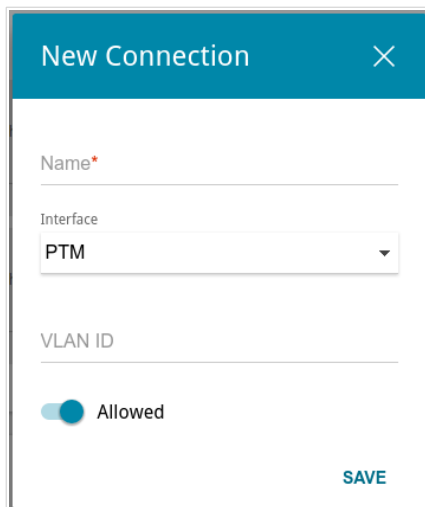

Figure 37. Adding a connection.

You can specify the following parameters:

| Parameter            | Description  |
|----------------------|--|
| <b>Name</b>          | A name for the connection for easier identification (you can specify any name).  |
| <b>Interface</b>     | Select the value corresponding to the LAN port specified as the WAN port for connection to an Ethernet line.<br>Select the <b>PTM</b> value for connection to a VDSL line or the <b>ATM</b> value for connection to an ADSL line.  |
| <b>VPI</b>           | <i>For the <b>ATM</b> value only.</i><br>Virtual Path Identifier. The valid range is from 0 to 255.  |
| <b>VCI</b>           | <i>For the <b>ATM</b> value only.</i><br>Virtual Circuit Identifier. The valid range is from 32 to 65535.  |
| <b>Encapsulation</b> | <i>For the <b>ATM</b> value only.</i><br>Select <b>LLC</b> or <b>VCMUX</b> from the drop-down list.  |
| <b>QoS class</b>     | <i>For the <b>ATM</b> value only.</i><br>A class of traffic for this connection.<br><b>UBR</b><br>( <i>Unspecified Bit Rate</i> ): The UBR service is used for applications that allow various delays and losses of packets. It is appropriate to use the UBR service for text/data/image transfer applications, as well as messaging, distribution, retrieval, and remote terminal applications.<br><b>UBR with PCR</b> |

| Parameter             | Description  |
|-----------------------|--|
|                       | <p><i>(Unspecified Bit Rate with Peak Cell Rate)</i>: The UBR service is used for applications that allow various delays and losses of packets. The Peak Cell Rate is a determining factor in how often cells are sent in an effort to minimize lag or jitter caused by traffic inconsistencies. When you select this value from the drop-down list, the <b>Peak cell rate</b> field is displayed. Specify a required value (in cells per second).</p> <p><b>CBR</b></p> <p><i>(Constant Bit Rate)</i>: This service is used for applications that require a constant data rate. It is mostly used for transferring uncompressed audio and video, e.g. videoconferencing, interactive audio (telephony), audio/video distribution (television, distance education, e-shops), and retrieval (video-on demand, audio libraries). When you select this value from the drop-down list, the <b>Peak cell rate</b> field is displayed. Specify a required value (in cells per second).</p> <p><b>Non Realtime VBR</b></p> <p><i>(Non-Real-time Variable Bit Rate)</i>: This service can be used for transferring data that have critical response-time requirements, e.g. air ticket booking, bank transactions, and process monitoring. When you select this value from the drop-down list, the <b>Peak cell rate</b>, <b>Sustainable cell rate</b>, and <b>Maximum burst size</b> fields are displayed. Specify required values.</p> <p><b>Realtime VBR</b></p> <p><i>(Real-time Variable Bit Rate)</i>: This service is used for delay-sensitive applications such as real time video. The Rt-VBR provides higher network flexibility than the CBR service. When you select this value from the drop-down list, the <b>Peak cell rate</b>, <b>Sustainable cell rate</b>, and <b>Maximum burst size</b> fields are displayed. Specify required values.</p> |
| <p><b>VLAN ID</b></p> | <p>If the service used by your additional equipment is provided via a VLAN channel with a tag (VLAN ID), specify the needed value.</p>   |
| <p><b>Allowed</b></p> | <p>Move the switch to the right to enable the connection.<br/>                     Move the switch to the left to disable the connection.</p>  |

Click the **SAVE** button.

Then in the **LAN** section, from the **Bridged with** drop-down list of the element corresponding to the LAN port or wireless interface to which the additional device is connected, select the created connection. Click the **APPLY** button.

 The selected port or wireless interface cannot use the default connection to access the Internet.

To deselect the port or wireless interface, select the **No** value from the **Bridged with** drop-down list of the element corresponding to the needed LAN port or interface. Then in the **WAN** section, select the connection which will not be used any longer and click the **REMOVE** button. Then click the **APPLY** button.

## Statistics

The pages of this section display data on the current state of the router:

- network statistics
- IP addresses leased by the DHCP server
- the routing table
- data on devices connected to the router's network and its web-based interface, and information on current sessions of these devices
- addresses of active multicast groups
- DSL connection status.

## Network Statistics

On the **Statistics / Network Statistics** page, you can view statistics for all connections existing in the system (WAN connections, LAN, WLAN). For each connection the following data are displayed: name and state (when the connection is on, its name is highlighted in green, when the connection is off, its name is highlighted in red), IP address and subnet mask, gateway (if the connection is established), MAC address, and volume of data received and transmitted (with increase of the volume the units of measurement are changed automatically: byte, Kbyte, Mbyte, Gbyte).

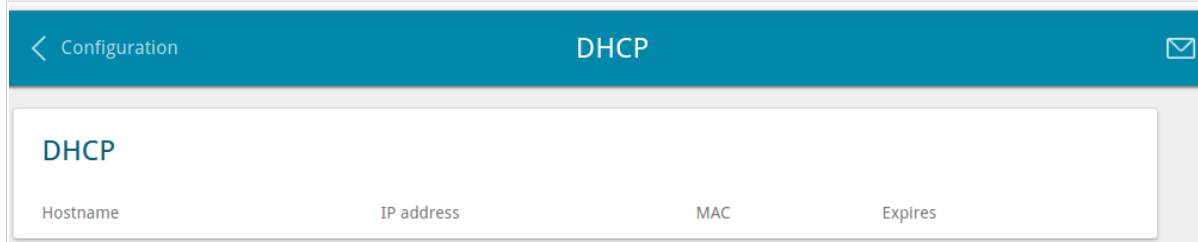

| Name            | IP - Gateway   | Rx/Tx                     | Rx/Tx errors | Duration |
|-----------------|--|---------------------------|--------------|----------|
| LAN             | IPv4: 192.168.1.1/24 – 192.168.1.1<br>IPv6: fd01::1/64 – - | 1.34 Mbyte / 3.65 Mbyte   | 0 / 0        | -        |
| Dynamic_IPv4_37 | -  | -                         | -            | -        |
| Dynamic_IPv4_1  | -  | -                         | -            | -        |
| WIFI            | -  | 11.58 Mbyte / 57.42 Kbyte | 0 / 0        | -        |

Figure 38. The **Statistics / Network Statistics** page.

To view data on a connection, click the line corresponding to this connection.

## DHCP

The **Statistics / DHCP** page displays the information on computers that have been identified by hostnames and MAC addresses and have got IP addresses from the DHCP server of the device.

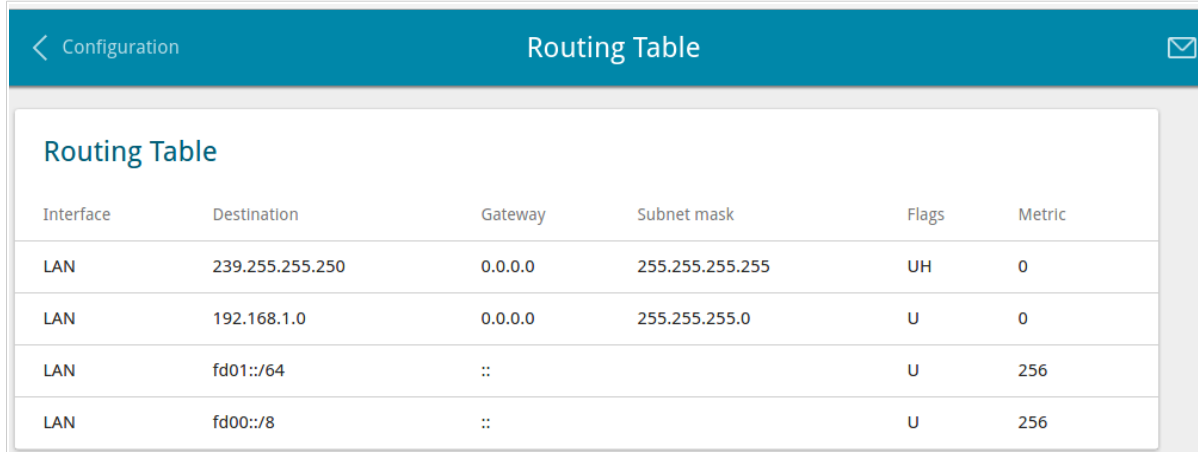

| Configuration |            | DHCP |         |
|---------------|------------|------|---------|
| DHCP          |            |      |         |
| Hostname      | IP address | MAC  | Expires |

Figure 39. The **Statistics / DHCP** page.

## Routing Table

The **Statistics / Routing Table** page displays the information on routes. The table contains destination IP addresses, gateways, subnet masks, and other data.

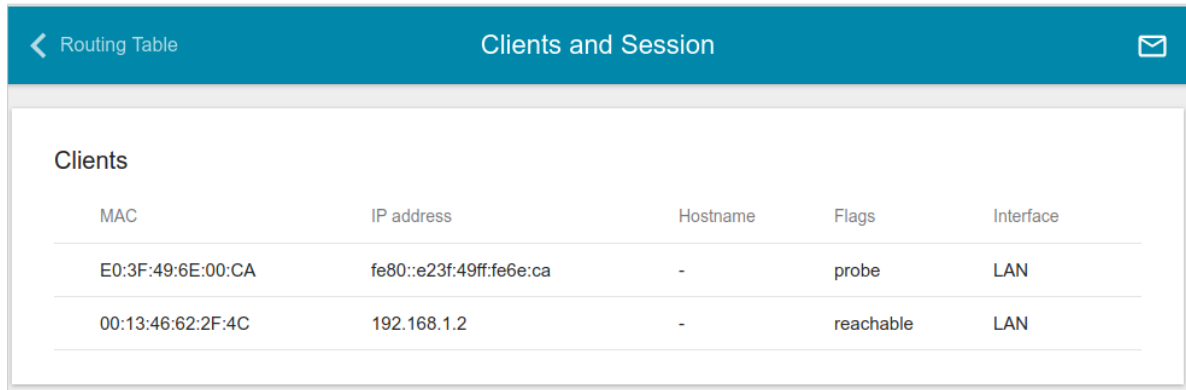

| Interface | Destination     | Gateway | Subnet mask     | Flags | Metric |
|-----------|-----------------|---------|-----------------|-------|--------|
| LAN       | 239.255.255.250 | 0.0.0.0 | 255.255.255.255 | UH    | 0      |
| LAN       | 192.168.1.0     | 0.0.0.0 | 255.255.255.0   | U     | 0      |
| LAN       | fd01::/64       | ::      |                 | U     | 256    |
| LAN       | fd00::/8        | ::      |                 | U     | 256    |

Figure 40. The **Statistics / Routing Table** page.

## Clients and Session

On the **Statistics / Clients and Session** page, you can view the list of devices connected to the local network of the router and information on current sessions of each device.

| MAC               | IP address              | Hostname | Flags     | Interface |
|-------------------|-------------------------|----------|-----------|-----------|
| E0:3F:49:6E:00:CA | fe80::e23f:49ff:fe6e:ca | -        | probe     | LAN       |
| 00:13:46:62:2F:4C | 192.168.1.2             | -        | reachable | LAN       |

Figure 41. The **Statistics / Clients and Session** page.

For each device the following data are displayed: the IP address, the MAC address, and the network interface to which the device is connected.

To view the information on current sessions of a device, select this device in the table. On the opened page, the following data for each session of the selected device will be displayed: the protocol for network packet transmission, the source IP address and port, and the destination IP address and port.

## Multicast Groups

The **Statistics / Multicast Groups** page displays addresses of active multicast groups (including IPTV channels and groups for transferring service information) to which the device is subscribed, and the interface through which the device is subscribed.

| IPv4            |           |
|-----------------|-----------|
| IP address      | Interface |
| 239.255.255.250 | LAN       |

| IPv6       |           |
|------------|-----------|
| IP address | Interface |

Figure 42. The **Statistics / Multicast Groups** page.

## DSL Status

The information shown on the **Statistics / DSL Status** page can be used for troubleshooting and diagnosing connection problems.

In the **DSL Status** and **Line** sections you can view data on your DSL line: the line state, data transfer rate (downstream/upstream traffic), physical parameters of the line (SNR, output power). The **Framing** section displays information on transmitted DSL frames.

The screenshot shows the 'DSL Status' page. At the top, there is a teal navigation bar with a back arrow and 'Clients and Session' on the left, and 'DSL Status' in the center with a mail icon on the right. Below this, the page is divided into three sections:

- DSL Status:** Shows 'Line status:' with a toggle switch currently set to 'Off'.
- Line:** A table showing parameters and their Up/Down values.
 

| Parameter       | Up | Down |
|-----------------|----|------|
| Rate            | -  | -    |
| Attainable rate | -  | -    |
| SNR Margin      | -  | -    |
| Attenuation     | -  | -    |
| Output power    | -  | -    |
- Framing:** A table showing parameters and their Up/Down values.
 

| Parameter                                 | Up | Down |
|---|----|------|
| K (number of bytes in DMT frame)          | -  | -    |
| R (number of check bytes in RS code word) | -  | -    |
| S (RS code word size in DMT frame)        | -  | -    |
| D (Interleaver depth)                     | -  | -    |

Figure 43. The **Statistics / DSL Status** page.

## Connections Setup

In this menu you can configure basic parameters of the router's local area network and configure connection to the Internet (a WAN connection).

### WAN

On the **Connections Setup / WAN** page, you can create and edit connections used by the router. By default, VDSL and ADSL connections of the **Dynamic IP** type are configured in the system. They are assigned to the DSL port of the router. You can edit these connections or delete them.

**!** Please reboot the router after creating, editing, or removing an ADSL WAN connection.

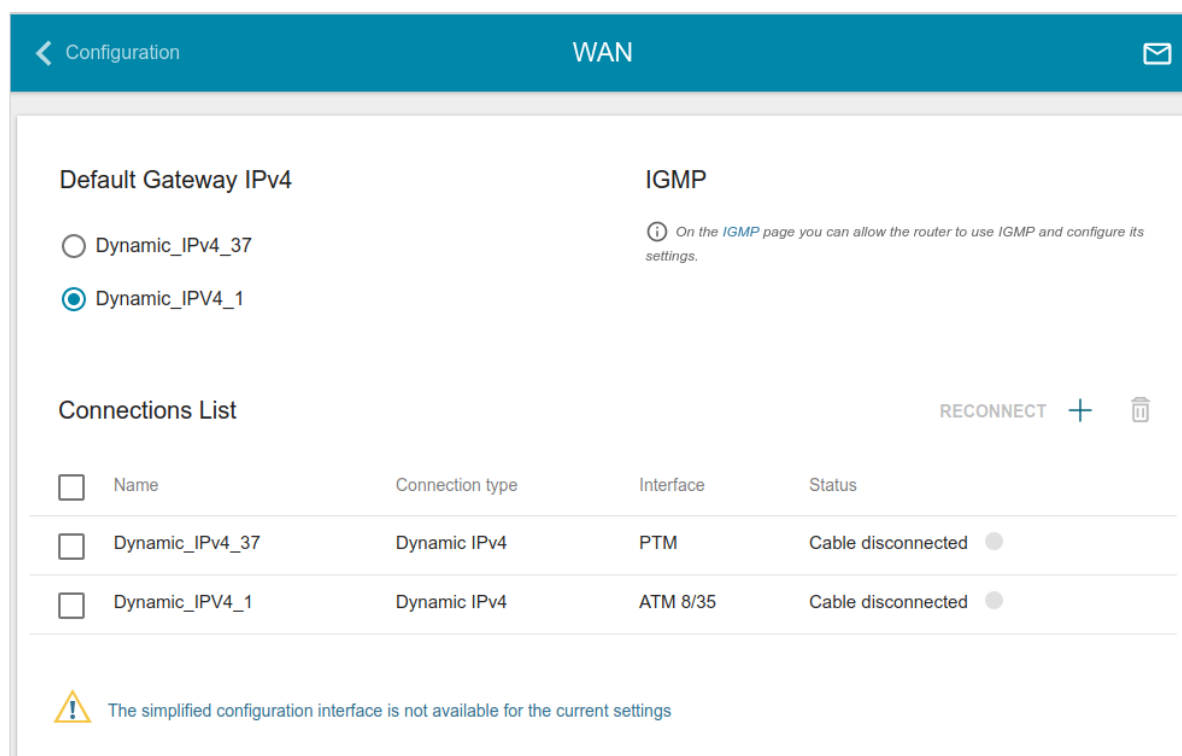

Figure 44. The **Connections Setup / WAN** page. The advanced mode.

To create a new connection, click the **ADD** button ( **+** ) in the **Connections List** section. Upon that the connection creation page opens.

To edit an existing connection, in the **Connections List** section, left-click the relevant line in the table. On the opened page, on the **Basic** tab, the mandatory settings of this WAN connection will be displayed. To view all available settings of the WAN connection, go to the **All Settings** tab. Change the needed parameters and click the **APPLY** button.

To disconnect a connection and establish it again, select the checkbox located to the left of the relevant line in the table and click the **RECONNECT** button.

To remove a connection, in the **Connections List** section, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (🗑️). Also you can remove a connection on the editing page.

To allow multicast traffic (e.g. streaming video) for a connection, click the **IGMP** link (for the description of the page, see the **IGMP** section, page 141).

To use one of existing WAN connections as the default IPv4 or IPv6 connection, in the **Default Gateway** section, select the choice of the radio button which corresponds to this connection.

To return to the simplified mode, click the **SIMPLIFIED MODE** button (the button is unavailable if several WAN connections are created).

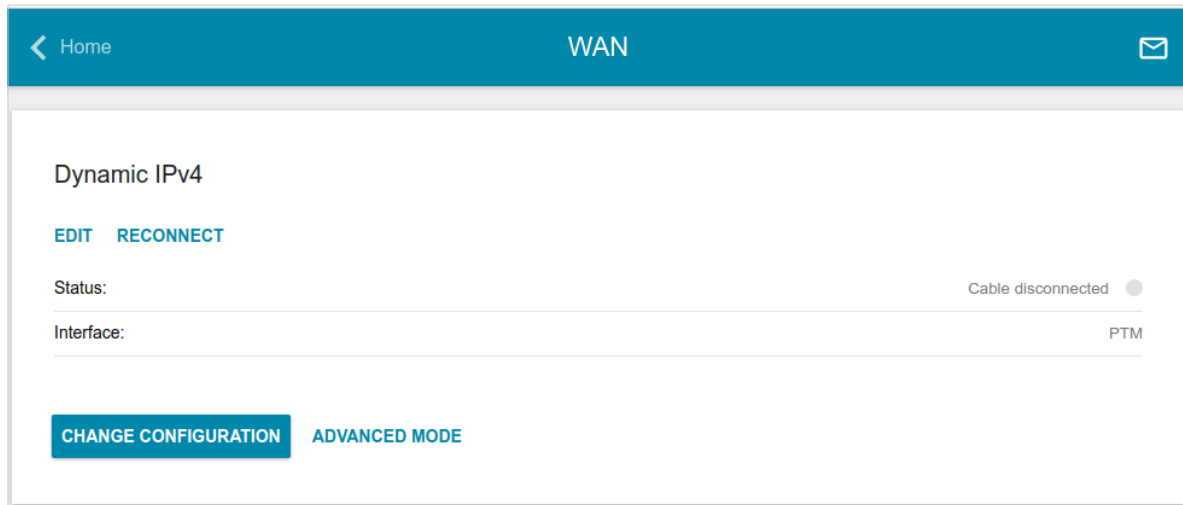

Figure 45. The **Connections Setup / WAN** page. The simplified mode.

To edit an existing connection, click the **EDIT** button. On the opened page, on the **Basic** tab, the mandatory settings of this connection will be displayed. To view all available settings of the WAN connection, go to the **All Settings** tab. Change the needed parameters and click the **APPLY** button.

To disconnect a connection and establish it again, click the **RECONNECT** button.

To remove an existing connection and create a new one, click the **CHANGE CONFIGURATION** button. Upon that the connection creation page opens.

To create several WAN connections, go to the advanced mode. To do this, click the **ADVANCED MODE** button.

**!** When connections of some types are created, the **Connections Setup / WAN** page is automatically displayed in the advanced mode.

## Creating Dynamic IPv4, Static IPv4, or IPoA WAN Connection

On the connection creation page, go to the **All Settings** tab. Then select the relevant value from the **Connection type** drop-down list and specify the needed values.

The screenshot shows a web form for creating a connection. It has three main sections:
 

- Connection type:** A dropdown menu with 'Static IPv4' selected.
- Interface:** A dropdown menu with 'PTM' selected.
- Enable connection:** A toggle switch that is currently turned on (blue).
- Connection name:** A text input field with a red asterisk indicating it is required, currently empty.

Figure 46. The page for creating a new **Static IPv4** connection. Selecting a connection type.

| Parameter                | Description   |
|--------------------------|---|
| <b>Interface</b>         | <p><i>For the <b>Dynamic IPv4</b> and <b>Static IPv4</b> types only.</i></p> <p>A physical interface to which the new connection will be assigned.</p> <p>In order to create an Ethernet WAN connection, select the value corresponding to the LAN port specified as the WAN port.</p> <p>In order to create a VDSL WAN connection, select the <b>PTM</b> value.</p> <p>In order to create an ADSL WAN connection, select the value corresponding to the existing interface or the <b>Add new ATM PVC</b> value for creating a new interface at the physical layer.</p> |
| <b>Enable connection</b> | <p>Move the switch to the right to enable the connection.</p> <p>Move the switch to the left to disable the connection.</p>   |
| <b>Connection name</b>   | <p><i>Available for the advanced mode only.</i></p> <p>A name for the connection for easier identification.</p>   |

The **Ethernet** section is displayed for Ethernet WAN connections.

| Parameter            | Description   |
|----------------------|---|
| <b>VLAN</b>          |   |
| <b>Use VLAN</b>      | Move the switch to the right to allow the router to use tagged VLAN connections.  |
| <b>VLAN ID</b>       | An identifier for the VLAN. The field is displayed when the <b>Use VLAN</b> switch is moved to the right.                         |
| <b>VLAN priority</b> | A priority tag for the type of traffic transmitted. The field is displayed when the <b>Use VLAN</b> switch is moved to the right. |

When all needed settings are configured, click the **APPLY** button.

## Creating PPPoE or PPPoA WAN Connection

On the connection creation page, go to the **All Settings** tab. Then select the relevant value from the **Connection type** drop-down list and specify the needed values.

The screenshot shows a configuration form with the following elements:

- Connection type:** A dropdown menu with 'PPPoE' selected.
- Interface:** A dropdown menu with 'PTM' selected.
- Enable connection:** A toggle switch that is currently turned on (blue).
- Connection name:** A text input field with a red asterisk indicating it is required, currently empty.

| Parameter                      | Description   |
|--------------------------------|---|
| <b>PPP</b>                     |   |
| <b>Without authorization</b>   | Move the switch to the right if you don't need to enter a username and password to access the Internet. |
| <b>Username</b>                | A username (login) to access the Internet.  |
| <b>Password</b>                | A password to access the Internet. Click the <b>Show</b> icon (🔍) to display the entered password.      |
| <b>Service name</b>            | <i>For the <b>PPPoE</b> type only.</i><br>The name of the PPPoE authentication server.                  |
| <b>MTU</b>                     | The maximum size of units transmitted by the interface.   |
| <b>Authentication protocol</b> | Select a required authentication method from the drop-down list or leave the <b>AUTO</b> value.         |

| Parameter                | Description   |
|--------------------------|---|
| <b>Keep Alive</b>        | Move the switch to the right if you want the router to keep you connected to your ISP even when the connection has been inactive for a specified period of time. If the switch is moved to the right, the <b>LCP interval</b> and <b>LCP fails</b> fields are available. Specify the required values. |
| <b>Dial on demand</b>    | Move the switch to the right if you want the router to establish connection to the Internet on demand. In the <b>Maximum idle time</b> field, specify a period of inactivity (in seconds) after which the connection should be terminated.  |
| <b>Static IP Address</b> | Fill in the field if you want to use a static IP address to access the Internet.  |
| <b>PPP IP extension</b>  | This option is used by some ISPs. Contact your ISP to clarify if this option needs to be enabled. If it is required, move the switch to the right.  |
| <b>PPP debug</b>         | Move the switch to the right if you want to log all data on PPP connection debugging.   |

Figure 65. The page for creating a new **PPPoE** connection. The **Miscellaneous** section.

| Parameter            | Description  |
|----------------------|--|
| <b>Miscellaneous</b> |  |
| <b>NAT</b>           | If the switch is moved to the right, the network address translation function is enabled. Do not disable the function unless your ISP requires this.   |
| <b>Firewall</b>      | If the switch is moved to the right, protection against external connections for the LAN devices is enabled (for example, against attempts to get information about the LAN devices or to hack a device from the LAN). For security reasons, it is recommended not to disable this function. |
| <b>RIP</b>           | Move the switch to the right to allow using RIP for this connection.   |
| <b>Ping</b>          | If the switch is moved to the right, the router responds to ping requests from the external network through this connection. For security reasons, it is recommended to disable this function.   |

The **VLAN** section is displayed for the **PPPoE** type.

Figure 66. The page for creating a new **PPPoE** connection. The **VLAN** section.

| Parameter            | Description   |
|----------------------|---|
| <b>VLAN</b>          |   |
| <b>Use VLAN</b>      | Move the switch to the right to allow the router to use tagged VLAN connections.  |
| <b>VLAN ID</b>       | An identifier for the VLAN. The field is displayed when the <b>Use VLAN</b> switch is moved to the right.                         |
| <b>VLAN priority</b> | A priority tag for the type of traffic transmitted. The field is displayed when the <b>Use VLAN</b> switch is moved to the right. |

When all needed settings are configured, click the **APPLY** button.

## Creating PPPoE IPv6 or PPPoE Dual Stack WAN Connection

On the connection creation page, go to the **All Settings** tab. Then select the relevant value from the **Connection type** drop-down list and specify the needed values.

Figure 67. The page for creating a new **PPPoE IPv6** connection. Selecting a connection type.

| Parameter                | Description  |
|--------------------------|--|
| <b>Interface</b>         | <p>A physical interface to which the new connection will be assigned.</p> <p>In order to create an Ethernet WAN connection, select the value corresponding to the LAN port specified as the WAN port.</p> <p>In order to create a VDSL WAN connection, select the <b>PTM</b> value.</p> <p>In order to create an ADSL WAN connection, select the value corresponding to the existing interface or the <b>Add new ATM PVC</b> value for creating a new interface at the physical layer.</p> |
| <b>Enable connection</b> | <p>Move the switch to the right to enable the connection.</p> <p>Move the switch to the left to disable the connection.</p>  |
| <b>Connection name</b>   | <p><i>Available for the advanced mode only.</i></p> <p>A name for the connection for easier identification.</p>  |

| <b>VLAN ID</b>       | An identifier for the VLAN. The field is displayed when the <b>Use VLAN</b> switch is moved to the right.                         |
| <b>VLAN priority</b> | A priority tag for the type of traffic transmitted. The field is displayed when the <b>Use VLAN</b> switch is moved to the right. |

When all needed settings are configured, click the **APPLY** button.

## LAN

To configure the router's local interface, go to the **Connections Setup / LAN** page.

### IPv4

Go to the **IPv4** tab to change IPv4 address, configure the built-in DHCP server, or specify MAC address and IP address pairs.

Local IP Address

IP address\*

192.168.1.1

Mask\*

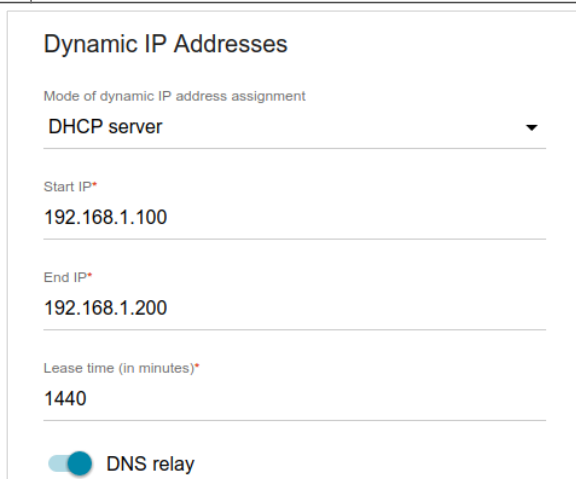

255.255.255.0

Hostname

dlinkrouter.local

| Parameter                                    | Description   |
|--|---|
| <b>Dynamic IP Addresses</b>                  |   |
| <b>Mode of dynamic IP address assignment</b> | <p>An operating mode of the router's DHCP server.</p> <p><b>Disable:</b> the router's DHCP server is disabled, clients' IP addresses are assigned manually.</p> <p><b>DHCP server:</b> the router assigns IP addresses to clients automatically in accordance with the specified parameters. When this value is selected, the <b>Start IP</b>, <b>End IP</b>, <b>Lease time</b> fields and the <b>DNS relay</b> switch are displayed on the tab.</p> <p><b>DHCP relay:</b> an external DHCP server is used to assign IP addresses to clients. When this value is selected, the <b>External DHCP server IP</b> and <b>Option 82 Remote ID</b> fields are displayed on the tab.</p> |
| <b>Start IP</b>                              | The start IP address of the address pool used by the DHCP server to distribute IP addresses to clients.   |
| <b>End IP</b>                                | The end IP address of the address pool used by the DHCP server to distribute IP addresses to clients.   |
| <b>Lease time</b>                            | The lifetime of IP addresses leased by the DHCP server. At the end of this period the leased IP address is revoked and can be distributed to another device, unless the previous device has confirmed the need to keep the address.   |
| <b>DNS Relay</b>                             | <p>Move the switch to the right so that the devices connected to the router obtain the address of the router as the DNS server address.</p> <p>Move the switch to the left so that the devices connected to the router obtain the address transmitted by the ISP or specified on the <b>Advanced / DNS</b> page as the DNS server address.</p>  |
| <b>External DHCP server IP</b>               | <p>The IP address of the external DHCP server which assigns IP addresses to the router's clients.</p> <p>To specify several IP addresses, click the <b>ADD</b> button, and in the line displayed, enter an IP address.</p> <p>To remove the IP address, click the <b>Delete</b> icon (✕) in the line of the address.</p>  |
| <b>Option 82 Remote ID</b>                   | <p>The value of the Remote ID field of DHCP option 82 in accordance with RFC3046.</p> <p>Do not fill in the field unless your ISP or the administrator of the external DHCP server provided this value.</p>   |

When all needed settings are configured, click the **APPLY** button.

In the **DHCP Options** section, you can change default values for some options of DHCP protocol (IP address, subnet mask, DNS servers) or specify additional parameters which the built-in DHCP server should send to clients to configure the local network.

Figure 82. The section for configuring DHCP options.

To do this, click the **ADD** button ( **+** ).

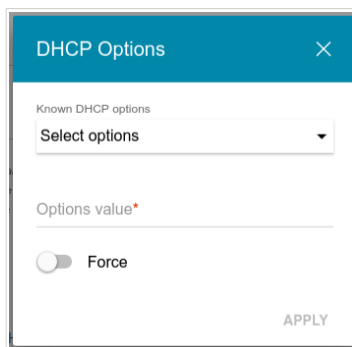

Figure 83. The window for configuring a DHCP option.

In the opened window, you can specify the following parameters:

| Parameter                 | Description   |
|---------------------------|---|
| <b>Known DHCP options</b> | From the drop-down list, select an option which you want to configure.  |
| <b>Options value</b>      | Specify the value for the selected option.  |
| <b>Force</b>              | Move the switch to the left to let the DHCP server send the selected option only when the client requests it. |

After specifying the needed parameters, click the **APPLY** button.

To edit the parameters of an option, left-click the relevant line in the table. In the opened window, change the needed parameters and click the **APPLY** button.

To remove the value of an option, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ). Then click the **APPLY** button.

In the **Static IP Addresses** section, you can specify MAC address and IPv4 address pairs (set a fixed IPv4 address in the local area network for a device with a certain MAC address). The router assigns IPv4 addresses in accordance with the specified pairs only when the DHCP server is enabled (in the **Dynamic IP Addresses** section, the **DHCP server** value is selected from the **Mode of dynamic IP address assignment** drop-down list).

Figure 84. The section for creating MAC-IPv4 pairs.

To create a MAC-IPv4 pair, click the **ADD** button (  ). In the opened window, in the **IP address** field, enter an IPv4 address which will be assigned to the device from the LAN, then in the **MAC address** field, enter the MAC address of this device. In the **Hostname** field, specify a network name of the device for easier identification (*optional*). Click the **APPLY** button.

In order to view MAC addresses of the devices connected to the router at the moment, click the **CLIENTS LIST** button. In the opened window, select the needed device and click the **OK** button. To view the latest list of the connected devices, click the **REFRESH** button.

To edit the settings for the existing MAC-IPv4 pair, left-click the relevant line in the table. In the opened window, change the needed parameters and click the **APPLY** button.

To remove a MAC-IPv4 pair, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ). Then click the **APPLY** button. Also you can remove a MAC-IPv4 pair in the editing window.

## IPv6

Go to the **IPv6** tab to change IPv6 address of the router and configure IPv6 addresses assignment settings.

**Local IPv6 Address**

Mode of local IPv6 address assignment

Figure 86. Configuring the local interface. The IPv6 tab. The **Dynamic IPv6 Addresses** section.

| Parameter                                      | Description  |
|--|--|
| <b>Dynamic IPv6 Addresses</b>                  |  |
| <b>Mode of dynamic IPv6 address assignment</b> | Select the needed value from the drop-down list.<br><br><b>Disable:</b> clients' IPv6 addresses are assigned manually.<br><br><b>Stateful:</b> the built-in DHCPv6 server of the router allocates addresses from the range specified in the <b>Start IPv6</b> and <b>End IPv6</b> fields.<br><br><b>Stateless:</b> clients themselves configure IPv6 addresses using the prefix. |
| <b>Start IPv6</b>                              | The start IPv6 address of the address pool used by the DHCPv6 server to distribute addresses to clients.   |
| <b>End IPv6</b>                                | The end IPv6 address of the address pool used by the DHCPv6 server to distribute addresses to clients.   |
| <b>Lease time</b>                              | The lifetime of IPv6 addresses provided to clients. The field is available for editing if the <b>Static</b> value is selected from the <b>Mode of local IPv6 address assignment</b> list in the <b>Local IPv6 Address</b> section.   |

When all needed settings are configured, click the **APPLY** button.

In the **Static IP Addresses** section, you can specify MAC address and IPv6 address pairs (set a fixed IPv6 address in the local area network for a device with a certain MAC address). The router assigns IPv6 addresses in accordance with the specified pairs only when the **Stateful** value is selected from the **Mode of dynamic IPv6 address assignment** drop-down list in the **Dynamic IPv6 Addresses** section.

Figure 87. The section for creating MAC-IPv6 pairs.

To create a MAC-IPv6 pair, click the **ADD** button (  ). In the opened window, in the **IP address** field, enter an IPv6 address which will be assigned to the device from the LAN, then in the **MAC address** field, enter the MAC address of this device. In the **Hostname** field, specify a network name of the device for easier identification (*optional*). Click the **APPLY** button.

In order to view MAC addresses of the devices connected to the router at the moment, click the **CLIENTS LIST** button. In the opened window, select the needed device and click the **OK** button. To view the latest list of the connected devices, click the **REFRESH** button.

To edit the settings for the existing MAC-IPv6 pair, left-click the relevant line in the table. In the opened window, change the needed parameters and click the **APPLY** button.

To remove a MAC-IPv6 pair, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ). Then click the **APPLY** button. Also you can remove a MAC-IPv6 pair in the editing window.

## Wi-Fi

In this menu you can specify all needed settings for your wireless network.

### Basic Settings

In the **Wi-Fi / Basic Settings** section, you can change basic parameters for the wireless interface of the router and configure the basic and additional wireless networks.

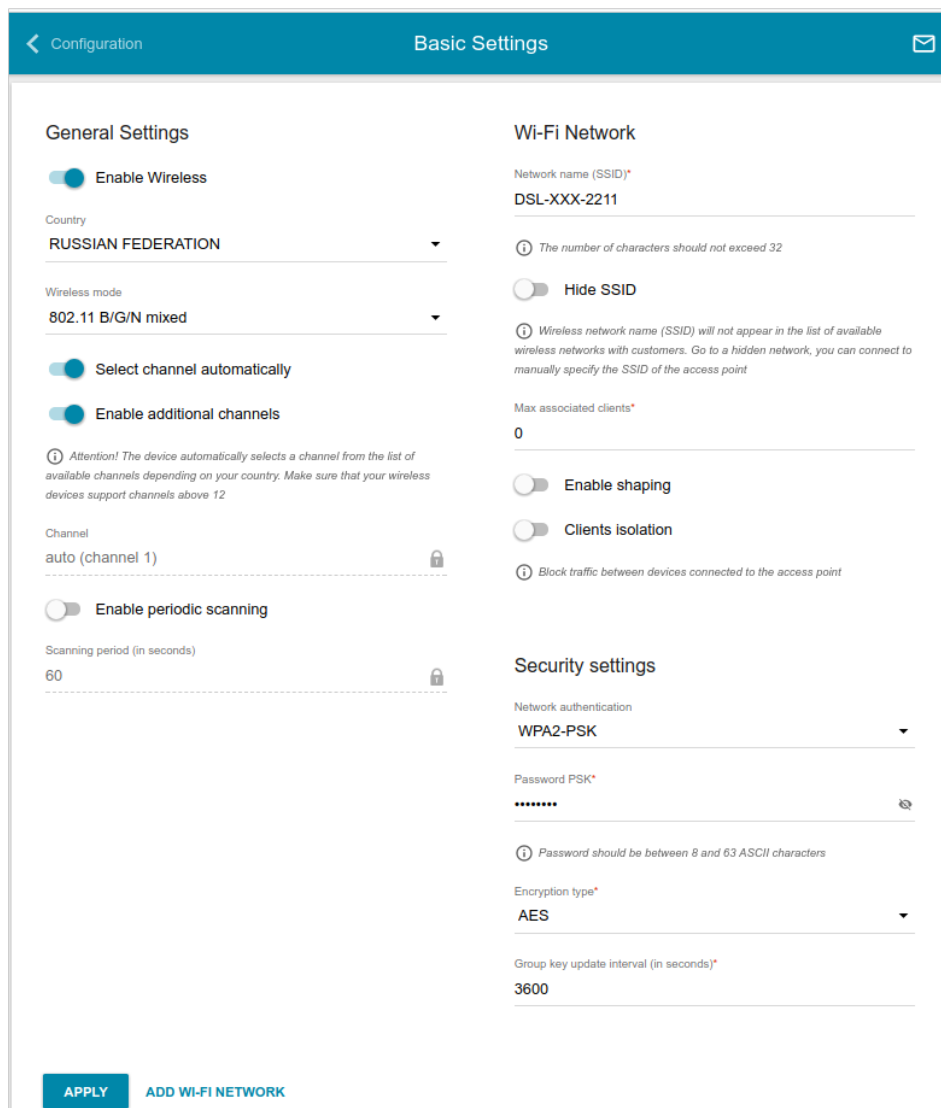

Figure 88. Basic settings of the wireless LAN.

In the **General Settings** section, the following parameters are available:

| Parameter              | Description  |
|------------------------|--|
| <b>Enable Wireless</b> | To enable Wi-Fi connection, move the switch to the right.<br>To disable Wi-Fi connection, move the switch to the left. |
| <b>Country</b>         | The country you are in. Select a value from the drop-down list.  |

| Parameter                           | Description  |
|-------------------------------------|--|
| <b>Wireless mode</b>                | Operating mode of the wireless network of the router. This parameter defines standards of the devices that will be able to use your wireless network. Select a value from the drop-down list.          |
| <b>Select channel automatically</b> | Move the switch to the right to let the router itself choose the channel with the least interference.  |
| <b>Enable additional channels</b>   | If the switch is moved to the left, the device automatically selects one of available standard channels. To use additional channels (the 12th and 13th), move the switch to the right.                 |
| <b>Channel</b>                      | The wireless channel number. Left-click to open the window for selecting a channel (the action is available, when the <b>Select channel automatically</b> switch is moved to the left).                |
| <b>Enable periodic scanning</b>     | Move the switch to the right to let the router search for a free channel in certain periods of time. When the switch is moved to the right, the <b>Scanning period</b> field is available for editing. |
| <b>Scanning period</b>              | Specify a period of time (in seconds) after which the router rescans channels.   |

When you have configured the parameters, click the **APPLY** button.

To edit the settings of the basic wireless network, in the **Wi-Fi Network** section, change the needed parameters and click the **APPLY** button.

Also you can create an additional wireless network. To do this, click the **ADD WI-FI NETWORK** button. On the opened page, specify the relevant parameters.

The screenshot shows the 'Add Wi-Fi Network' configuration page. The page has a teal header with a back arrow, 'Basic Settings', 'Add Wi-Fi Network', and an envelope icon. The main content area is white and divided into two columns. The left column is titled 'Wi-Fi Network' and contains: a text input for 'Network name (SSID)\*' with a note 'The number of characters should not exceed 32'; a toggle for 'Hide SSID' with a note 'Wireless network name (SSID) will not appear in the list of available wireless networks with customers. Go to a hidden network, you can connect to manually specify the SSID of the access point'; a text input for 'Max associated clients\*' set to '0'; a toggle for 'Enable shaping'; a toggle for 'Clients isolation' with a note 'Block traffic between devices connected to the access point'; a toggle for 'Enable guest network' with a note 'Enable the guest network in order to isolate Wi-Fi clients from the LAN network'; and a blue 'APPLY' button at the bottom. The right column is titled 'Security settings' and contains: a dropdown for 'Network authentication' set to 'WPA2-PSK'; a text input for 'Password PSK\*' with a note 'Password should be between 8 and 63 ASCII characters' and a toggle for visibility; a dropdown for 'Encryption type\*' set to 'AES'; and a text input for 'Group key update interval (in seconds)\*' set to '3600'.

Figure 89. Creating a wireless network.

| Parameter                     | Description  |
|-------------------------------|--|
| <b>Wi-Fi Network</b>          |  |
| <b>Network name (SSID)</b>    | A name for the wireless network. The name can consist of digits and Latin characters.  |
| <b>Hide SSID</b>              | If the switch is moved to the right, other users cannot see your Wi-Fi network. It is recommended not to hide the network in order to simplify initial configuration of the wireless network.  |
| <b>BSSID</b>                  | The unique identifier for this wireless network. You cannot change the value of this parameter, it is determined in the device's internal settings. The field is displayed in the settings of the existing wireless network.                           |
| <b>Max associated clients</b> | The maximum number of devices connected to the wireless network. When the value <b>0</b> is specified, the device does not limit the number of connected clients.  |
| <b>Enable shaping</b>         | <p>Move the switch to the right to limit the maximum bandwidth of the wireless network. In the <b>Shaping</b> field displayed, specify the maximum value of speed (Mbit/s).</p> <p>Move the switch to the left not to limit the maximum bandwidth.</p> |
| <b>Clients isolation</b>      | Move the switch to the right to forbid wireless clients of this wireless network to communicate to each other.   |
| <b>Enable guest network</b>   | This function is available for the additional network. Move the switch to the right if you want the devices connected to the additional network to be isolated from the devices and resources of the router's LAN.                                     |

In the **Security Settings** section, you can change security settings of the wireless network. By default, the **WPA2-PSK** network authentication type of the wireless network is specified.

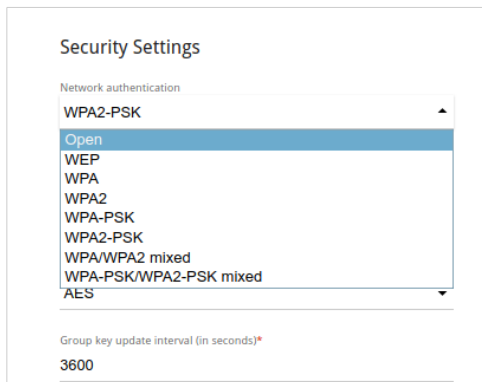

Figure 90. Network authentication types supported by the router.

The router supports the following authentication types:

| Authentication type           | Description  |
|-------------------------------|--|
| <b>Open</b>                   | Open authentication (with WEP encryption for wireless network modes not supporting 802.11n devices).   |
| <b>WEP</b>                    | Authentication with a shared key with WEP encryption. This authentication type is not available when a mode supporting 802.11n devices is selected from the <b>Wireless mode</b> drop-down list on the <b>Wi-Fi / Basic Settings</b> page. |
| <b>WPA</b>                    | WPA-based authentication using a RADIUS server.  |
| <b>WPA-PSK</b>                | WPA-based authentication using a PSK.  |
| <b>WPA2</b>                   | WPA2-based authentication using a RADIUS server.   |
| <b>WPA2-PSK</b>               | WPA2-based authentication using a PSK.   |
| <b>WPA/WPA2 mixed</b>         | A mixed type of authentication. When this value is selected, devices using the <b>WPA</b> authentication type and devices using the <b>WPA2</b> authentication type can connect to the wireless network.                                   |
| <b>WPA-PSK/WPA2-PSK mixed</b> | A mixed type of authentication. When this value is selected, devices using the <b>WPA-PSK</b> authentication type and devices using the <b>WPA2-PSK</b> authentication type can connect to the wireless network.                           |

**!** The **WPA**, **WPA2**, and **WPA/WPA2 mixed** authentication types require a RADIUS server.

When the **Open** or **WEP** value is selected, the following settings are displayed on the page (unavailable for the wireless network operating modes which support the standard 802.11n):

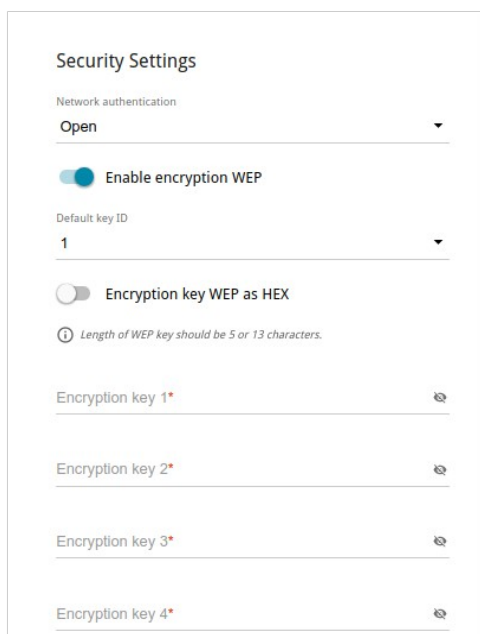

Figure 91. The **Open** value is selected from the **Network authentication** drop-down list.

| Parameter                        | Description   |
|----------------------------------|---|
| <b>Enable encryption WEP</b>     | <i>For <b>Open</b> authentication type only.</i><br>To activate WEP encryption, move the switch to the right. Upon that the <b>Default key ID</b> drop-down list, the <b>Encryption key WEP as HEX</b> switch, and four <b>Encryption key</b> fields are displayed on the page.                 |
| <b>Default key ID</b>            | The number of the key (from first to fourth) which will be used for WEP encryption.   |
| <b>Encryption key WEP as HEX</b> | Move the switch to the right to set a hexadecimal number as a key for encryption.   |
| <b>Encryption key (1-4)</b>      | Keys for WEP encryption. The router uses the key selected from the <b>Default key ID</b> drop-down list. It is required to specify all the fields. Click the <b>Show</b> icon (  ) to display the entered key. |

When the **WPA-PSK**, **WPA2-PSK**, or **WPA-PSK/WPA2-PSK mixed** value is selected, the following fields are displayed on the page:

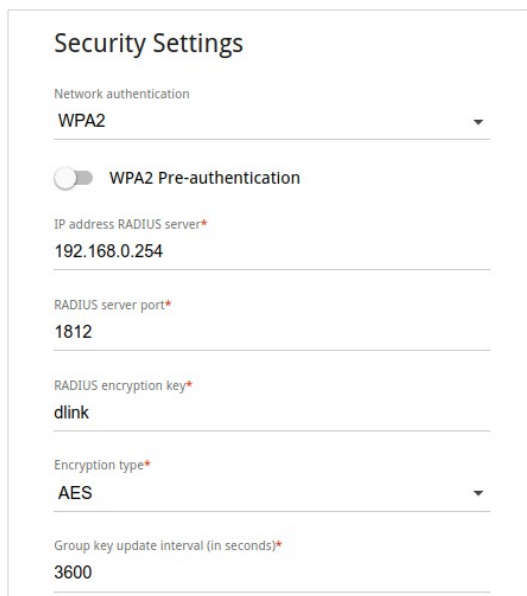

The screenshot shows a 'Security Settings' form. The 'Network authentication' dropdown menu is set to 'WPA2-PSK'. Below it is a 'Password PSK\*' field containing several dots and a 'Show' icon (an eye with a slash). A tooltip below the password field states: 'Password should be between 8 and 63 ASCII characters'. The 'Encryption type\*' dropdown menu is set to 'TKIP'. At the bottom, the 'Group key update interval (in seconds)\*' is set to '3600'.

Figure 92. The **WPA2-PSK** value is selected from the **Network authentication** drop-down list.

| Parameter                        | Description  |
|----------------------------------|--|
| <b>Password PSK</b>              | A password for WPA encryption. The password can contain digits, Latin letters (uppercase and/or lowercase), and other characters available in the US keyboard layout. <sup>2</sup> Click the <b>Show</b> icon (👁) to display the entered password. |
| <b>Encryption type</b>           | An encryption method: <b>TKIP</b> , <b>AES</b> , or <b>TKIP+AES</b> .  |
| <b>Group key update interval</b> | The time period (in seconds), at the end of which a new key for WPA encryption is generated. When the value <b>0</b> is specified for this field, the key is not renewed.  |

<sup>2</sup> 0-9, A-Z, a-z, space, !"#\$%&'()\*+,-./:;<=>?@[\\]^\_`{|}~.

When the **WPA**, **WPA2**, or **WPA/WPA2 mixed** value is selected, the following settings are displayed on the page:

The screenshot shows the 'Security Settings' section of a web interface. Under 'Network authentication', 'WPA2' is selected in a dropdown menu. Below this, there is a toggle switch for 'WPA2 Pre-authentication' which is currently turned off. Further down, there are input fields for 'IP address RADIUS server\*' (192.168.0.254), 'RADIUS server port\*' (1812), 'RADIUS encryption key\*' (dlink), 'Encryption type\*' (AES), and 'Group key update interval (in seconds)\*' (3600).

Figure 93. The **WPA2** value is selected from the **Network authentication** drop-down list.

| Parameter                        | Description   |
|----------------------------------|---|
| <b>WPA2 Pre-authentication</b>   | Move the switch to the right to activate preliminary authentication (displayed only for the <b>WPA2</b> and <b>WPA/WPA2 mixed</b> authentication types).                  |
| <b>IP address RADIUS server</b>  | The IP address of the RADIUS server.  |
| <b>RADIUS server port</b>        | A port of the RADIUS server.  |
| <b>RADIUS encryption key</b>     | The password which the router uses for communication with the RADIUS server (the value of this parameter is specified in the RADIUS server settings).                     |
| <b>Encryption type</b>           | An encryption method: <b>TKIP</b> , <b>AES</b> , or <b>TKIP+AES</b> .   |
| <b>Group key update interval</b> | The time period (in seconds), at the end of which a new key for WPA encryption is generated. When the value <b>0</b> is specified for this field, the key is not renewed. |

When you have configured the parameters, click the **APPLY** button.

To edit the basic or additional wireless network, left-click the relevant line in the table. On the opened page, change the needed parameters and click the **APPLY** button.

To remove the additional network, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ). Then click the **APPLY** button.

## Client Management

On the **Wi-Fi / Client Management** page, you can view the list of wireless clients connected to the router.

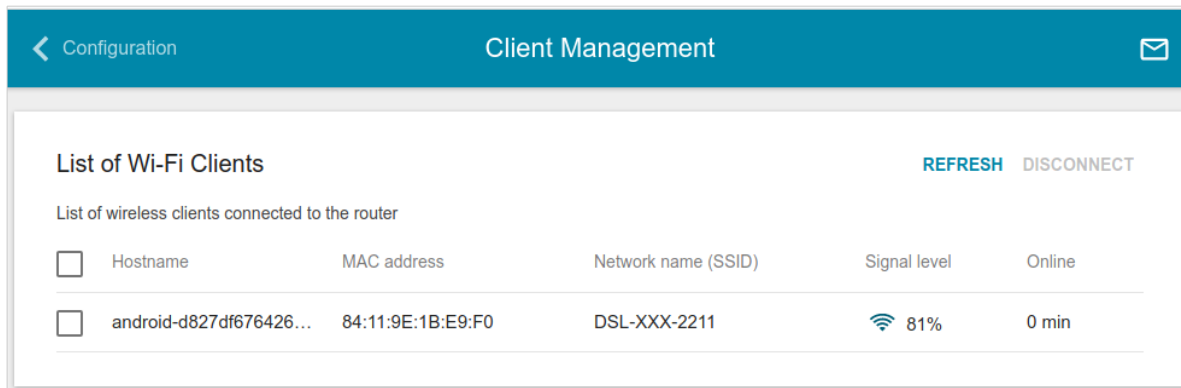

Figure 94. The page for managing the wireless clients.

If you want to disconnect a wireless device from your WLAN, select the checkbox in the line containing the MAC address of this device and click the **DISCONNECT** button.

To view the latest data on the devices connected to the WLAN, click the **REFRESH** button.

## WPS

On the **Wi-Fi / WPS** page, you can enable the function for configuration of the WLAN and select a method for connection to the WLAN.

The WPS function helps to configure the protected wireless network automatically. Devices connecting to the wireless network via the WPS function must support the WPS function.

! The WPS function allows adding devices only to the basic wireless network of the router.

! Before using the function you need to configure one of the following authentication types: **Open** with no encryption, **WPA2-PSK** or **WPA-PSK/WPA2-PSK mixed** with the **AES** encryption method. When other security settings are specified, controls of the **WPS** page are not available.

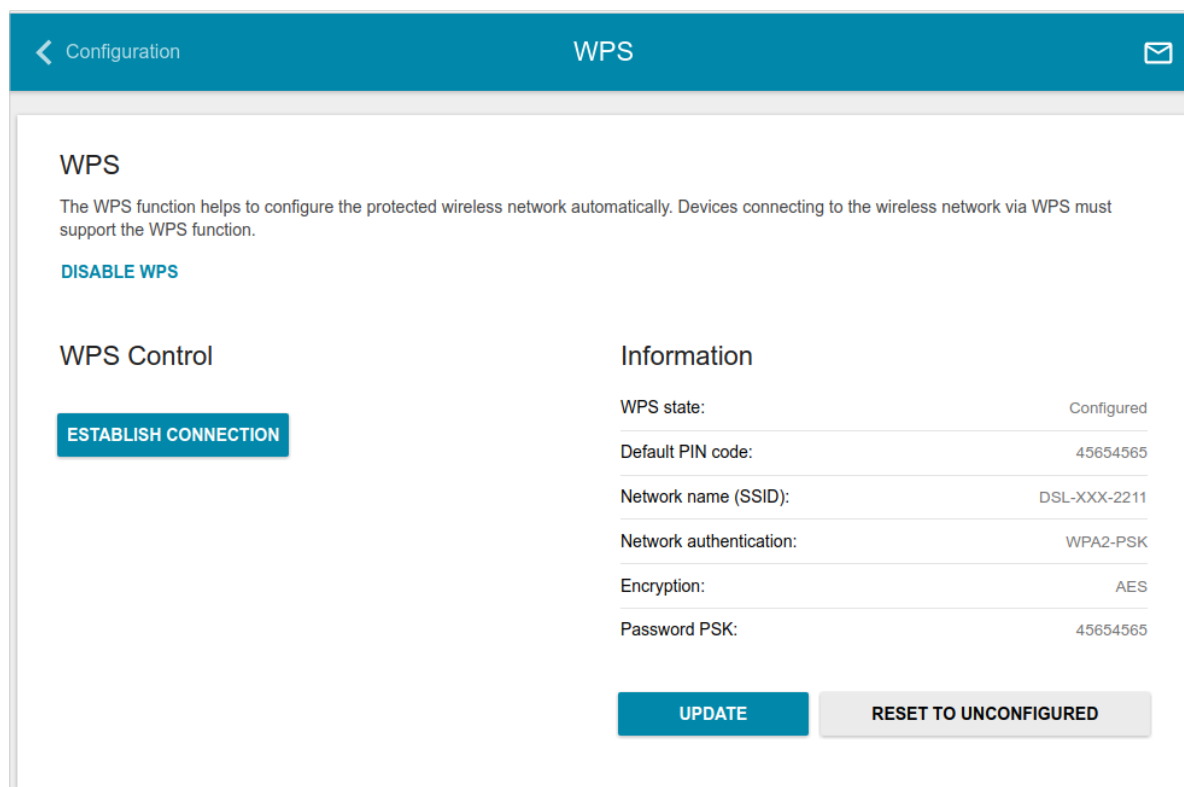

Figure 95. The page for configuring the WPS function.

To activate the WPS function, click the **ENABLE WPS** button.

When the WPS function is enabled, the **Information** section is available on the page.

| Parameter                     | Description  |
|-------------------------------|--|
| <b>WPS state</b>              | The state of the WPS function: <ul style="list-style-type: none"> <li>• <b>Configured</b> (all needed settings are specified; these settings will be used upon establishing the wireless connection)</li> <li>• <b>Unconfigured</b> (after activating the WPS function, the SSID and the encryption key will be configured automatically, the network authentication type will be changed to WPA2-PSK).</li> </ul> |
| <b>Default PIN code</b>       | The PIN code of the router. This parameter is used when connecting the router to a registrar to set the parameters of the WPS function.  |
| <b>Network name (SSID)</b>    | The name of the router's wireless network.   |
| <b>Network Authentication</b> | The network authentication type specified for the wireless network.  |
| <b>Encryption</b>             | The encryption type specified for the wireless network.  |
| <b>Password PSK</b>           | The encryption password specified for the wireless network.  |
| <b>UPDATE</b>                 | Click the button to update the data on the page.   |
| <b>RESET TO UNCONFIGURED</b>  | Click the button to reset the parameters of the WPS function.  |

## ***Using WPS Function via Web-based Interface***

To connect to the basic wireless network via the PIN method of the WPS function, follow the next steps:

1. Click the **ENABLE WPS** button.
2. In the **WPS Control** section, click the **ESTABLISH CONNECTION** button.
3. In the opened window, select the **PIN** value from the **WPS method** drop-down list.
4. Select the PIN method in the software of the wireless device that you want to connect to the router's WLAN.
5. Click the relevant button in the software of the wireless device that you want to connect to the WLAN.
6. Right after that, enter the PIN code specified on the cover of the wireless device or in its software in the **PIN Code** field.
7. Click the **CONNECT** button in the web-based interface of the router.

To connect to the basic wireless network via the PBC method of the WPS function, follow the next steps:

1. Click the **ENABLE WPS** button.
2. In the **WPS Control** section, click the **ESTABLISH CONNECTION** button.
3. In the opened window, select the **PBC** value from the **WPS method** drop-down list.
4. Select the PBC method in the software of the wireless device that you want to connect to the router's WLAN.
5. Click the relevant button in the software or press the WPS button on the cover of the wireless device that you want to connect to the WLAN.
6. Right after that, click the **CONNECT** button in the web-based interface of the router.

## ***Using WPS Function without Web-based Interface***

You can use the WPS function without accessing the web-based interface of the router. To do this, you need to configure the following router's settings:

1. Specify relevant security settings for the wireless network of the router.
2. Click the **ENABLE WPS** button.
3. Save the settings and close the web-based interface (click the **Logout** line of the menu).

Later you will be able to add wireless devices to the WLAN by pressing the **WPS** button of the router.

1. Select the PBC method in the software of the wireless device that you want to connect to the router's WLAN.
2. Click the relevant button in the software or press the WPS button on the cover of the wireless device that you want to connect to the WLAN.
3. Press the **WPS** button of the router and release. The **WPS** LED will start blinking.

## WMM

On the **Wi-Fi / WMM** page, you can enable the Wi-Fi Multimedia function.

The WMM function implements the QoS features for Wi-Fi networks. It helps to improve the quality of data transfer over Wi-Fi networks by prioritizing different types of traffic.

Select the needed action from the **Work mode** drop-down list to configure the WMM function:

- **Auto**: the settings of the WMM function are configured automatically (the value is specified by default).
- **Manual**: the settings of the WMM function are configured manually. When this value is selected, the **Access Point** and **Station** sections are displayed on the page.
- **Disabled**: the WMM function is disabled.

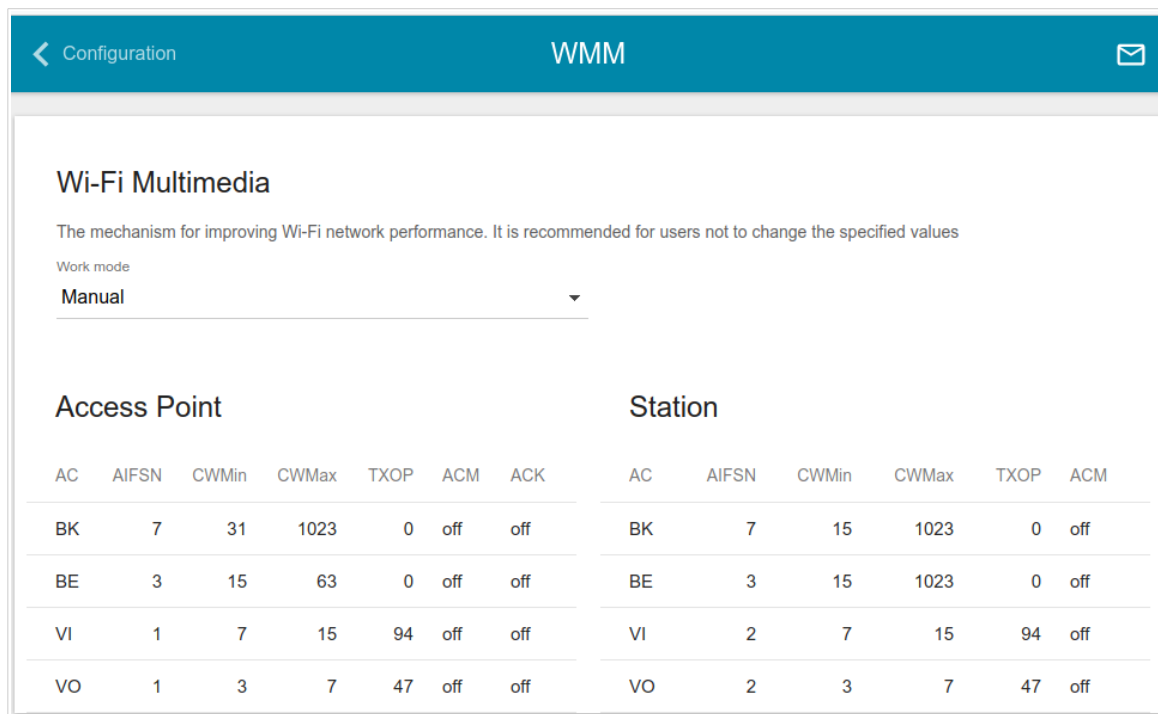

Figure 96. The page for configuring the WMM function.

**!** All needed settings for the WMM function are specified in the device's system. Changing parameters manually may negatively affect your WLAN!

The WMM function allows assigning priorities for four Access Categories (AC):

- **BK** (*Background*), low priority traffic (print jobs, file downloads, etc.).
- **BE** (*Best Effort*), traffic from legacy devices or devices/applications that do not support QoS.
- **VI** (*Video*).
- **VO** (*Voice*).

Parameters of the Access Categories are defined for both the router itself (in the **Access Point** section) and wireless devices connected to it (in the **Station** section).

To edit the parameters of an Access Category, left-click the relevant line. In the opened window, change the needed parameters.

Figure 97. The window for changing parameters of the WMM function.

| Parameter          | Description  |
|--------------------|--|
| <b>AIFSN</b>       | <i>Arbitrary Inter-Frame Space Number.</i> This parameter influences time delays for the relevant Access Category. The lower the value, the higher is the Access Category priority.  |
| <b>CWMin/CWMax</b> | <i>Contention Window Minimum/Contention Window Maximum.</i> Both fields influence time delays for the relevant Access Category. The <b>CWMax</b> field value should not be lower, than the <b>CWMin</b> field value. The lower the difference between the <b>CWMax</b> field value and the <b>CWMin</b> field value, the higher is the Access Category priority. |

| Parameter   | Description  |
|-------------|--|
| <b>TXOP</b> | <i>Transmission Opportunity.</i> The higher the value, the higher is the Access Category priority.   |
| <b>ACM</b>  | <i>Admission Control Mandatory.</i><br>If the switch is moved to the right, the device cannot use the relevant Access Category.  |
| <b>ACK</b>  | <i>Acknowledgment.</i> Answering response requests while transmitting. Displayed only in the <b>Access Point</b> section.<br>If the switch is moved to the left, the router answers requests.<br>If the switch is moved to the right, the router does not answer requests. |

Click the **SAVE** button.

## Additional

On page of the **Wi-Fi / Additional** section, you can define additional parameters for the WLAN of the router.

**!** Changing parameters presented on this page may negatively affect your WLAN!

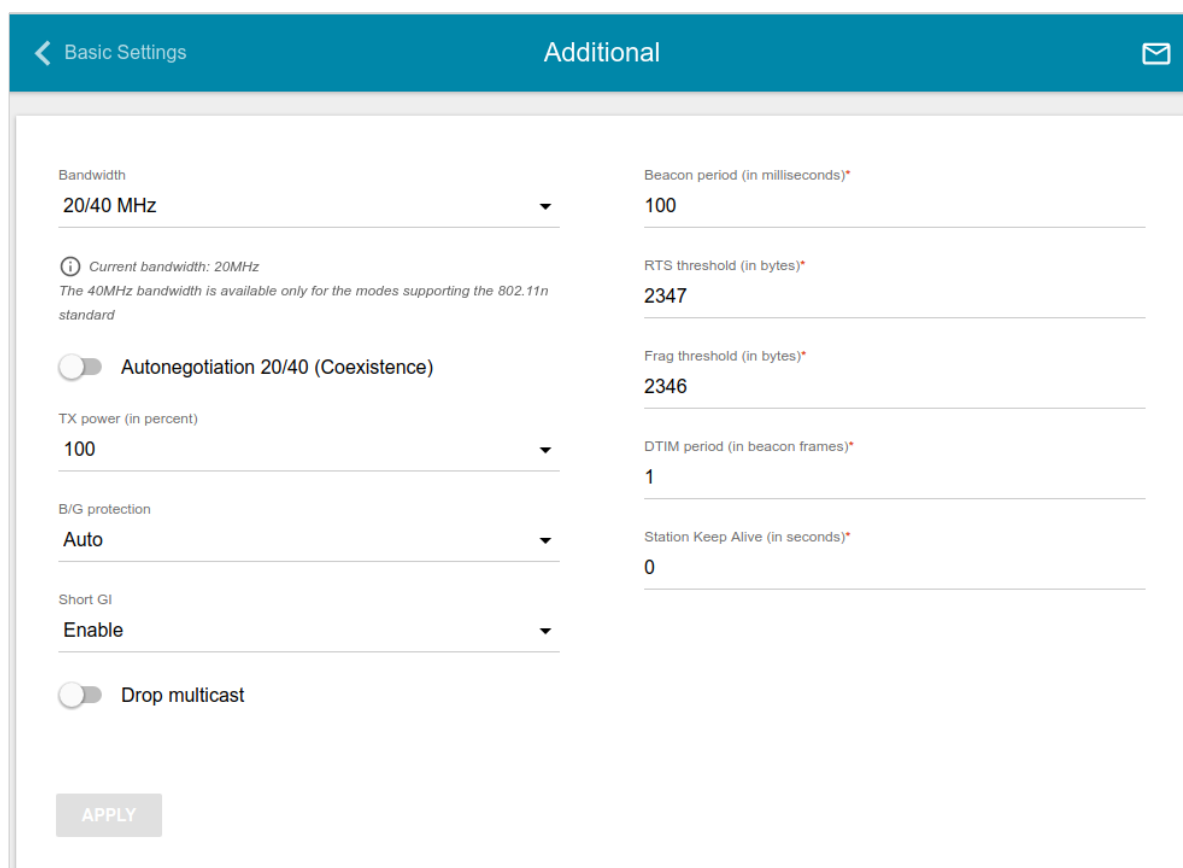

Figure 98. Additional settings of the WLAN.

The following fields are available on the page:

| Parameter                                  | Description   |
|--|---|
| <b>Bandwidth</b>                           | The channel bandwidth for 802.11n standard.<br><b>20MHz:</b> 802.11n clients operate at 20MHz channels.<br><b>20/40MHz:</b> 802.11n clients operate at 20MHz or 40MHz channels.   |
| <b>Autonegotiation 20/40 (Coexistence)</b> | Move the switch to the right to let the router to automatically choose the most suitable channel bandwidth (20MHz or 40MHz) for the connected devices (this setting can substantially lower the data transfer rate of your wireless network). The switch is displayed when the <b>20/40 MHz</b> value is selected from the <b>Bandwidth</b> drop-down list. |
| <b>TX power</b>                            | The transmit power (in percentage terms) of the router.   |

| Parameter                 | Description   |
|---------------------------|---|
| <b>B/G protection</b>     | <p>The 802.11b and 802.11g protection function is used to minimize collisions between devices of your wireless network.</p> <p>Select a value from the drop-down list.</p> <p><b>Auto:</b> The protection function is enabled and disabled automatically depending on the state of the network (this value is recommended if your wireless local area network consists of both 802.11b and 802.11g devices).</p> <p><b>Always On:</b> The protection function is always enabled (this setting can substantially lower the efficiency of your wireless network).</p> <p><b>Always Off:</b> The protection function is always disabled.</p> |
| <b>Short GI</b>           | <p>Guard interval (in nanoseconds). This parameter defines the interval between symbols transmitted when the router is communicating to wireless devices.</p> <p><b>Enable:</b> the router uses the 400 ns short guard interval. Only for the wireless network operating modes which support 802.11n standard (see the value of the <b>Wireless mode</b> drop-down list on the <b>Wi-Fi / Basic Settings</b> page).</p> <p><b>Disable:</b> the router uses the 800 ns standard guard interval.</p>  |
| <b>Drop multicast</b>     | <p>Move the switch to the right to disable multicasting for the router's WLAN. Move the switch to the left to enable multicasting from the WAN connection selected on the <b>Advanced / IGMP</b> page.</p>  |
| <b>Beacon Period</b>      | <p>The time interval (in milliseconds) between packets sent to synchronize the wireless network.</p>  |
| <b>RTS threshold</b>      | <p>The minimum size (in bytes) of a packet for which an RTS frame is transmitted.</p>   |
| <b>Frag threshold</b>     | <p>The maximum size (in bytes) of a non-fragmented packet. Larger packets are fragmented (divided).</p>   |
| <b>DTIM period</b>        | <p>The number of beacon frames between sending DTIM messages (messages notifying on broadcast or multicast transmission).</p>   |
| <b>Station Keep Alive</b> | <p>The time interval (in seconds) between keep alive checks of wireless devices from your WLAN. When the value <b>0</b> is specified, the checking is disabled.</p>   |

When you have configured the parameters, click the **APPLY** button.

## MAC Filter

On the **Wi-Fi / MAC Filter** page, you can define a set of MAC addresses of devices which will be allowed to access the WLAN, or define MAC addresses of devices which will not be allowed to access the WLAN.

**!** It is recommended to configure the Wi-Fi MAC filter through a wired connection to DSL-224.

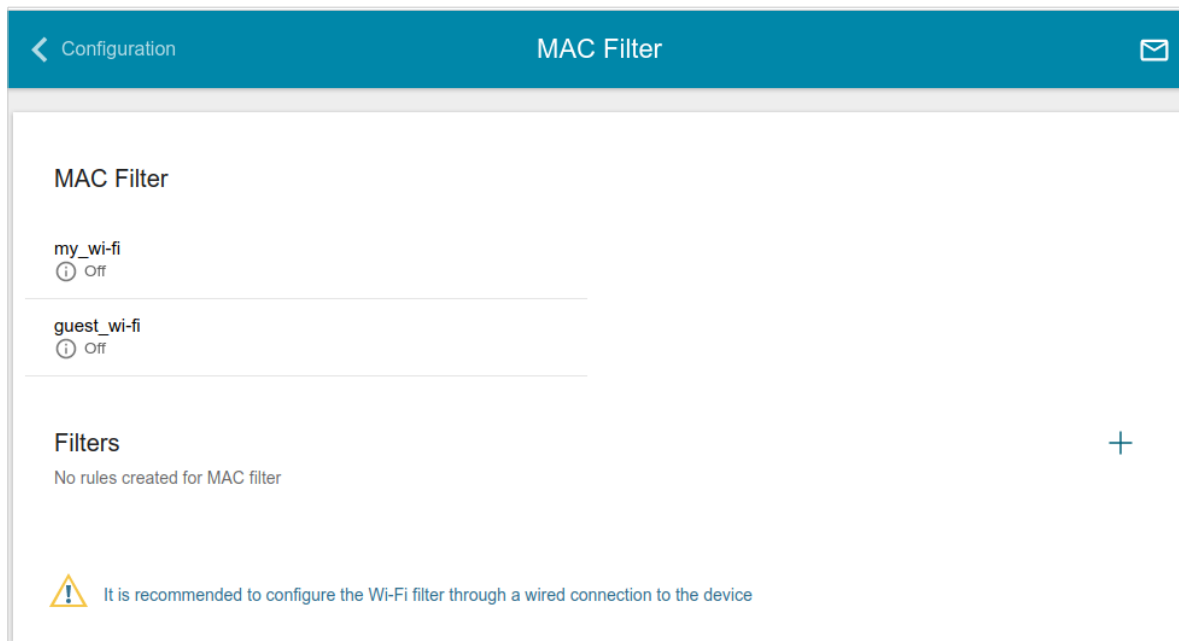

Figure 99. The page for configuring the MAC filter for the wireless network.

By default, the Wi-Fi MAC filter is disabled.

To configure the MAC filter, first you need to create rules (specify MAC addresses of devices for which the specified filtering modes will be applied). To do this, click the **ADD** button ( **+** ).

Figure 100. The window for adding a rule for the MAC filter.

You can specify the following parameters:

| Parameter          | Description  |
|--------------------|--|
| <b>SSID</b>        | A wireless network to which the rule will be applied. Select the needed value from the drop-down list.       |
| <b>MAC address</b> | In the field, enter the MAC address to which the selected filtering mode will be applied.                    |
| <b>Hostname</b>    | The name of the device for easier identification. You can specify any name.                                  |
| <b>Enable</b>      | If the switch is moved to the right, the rule is active.<br>Move the switch to the left to disable the rule. |

When you have configured the parameters, click the **SAVE** button.

To edit the parameters of the existing rule, in the **Filters** section, left-click the needed rule. In the opened window, change the settings and click the **SAVE** button.

To remove the rule from the page, in the **Filters** section, select the checkbox located to the left of the relevant rule and click the **DELETE** button (  ).

After creating the rules you need to configure the filtering modes.

To open the basic or additional wireless network for the devices which MAC addresses are specified on this page and to close the wireless network for all other devices, left-click the line of the wireless network. In the opened window, move the **Enable MAC filter** switch to the right. Upon that the **MAC filter restrict mode** drop-down list will be displayed. Select the **Allow** value from the drop-down list and click the **SAVE** button.

To close the wireless network for the devices which MAC addresses are specified on this page, select the **Deny** value from the **MAC filter restrict mode** drop-down list and click the **SAVE** button.

## ***Advanced***

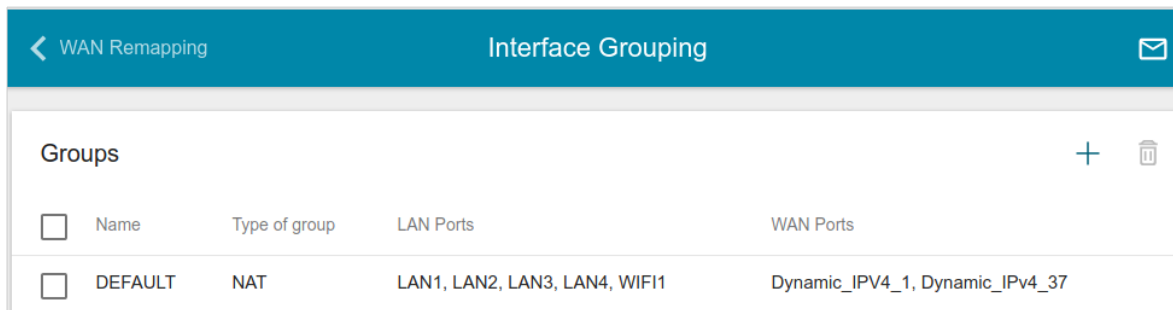

In this menu you can configure advanced settings of the router:

- define interface groups
- allow the router to connect to a private Ethernet line
- add name servers
- configure a DDNS service
- define static routes
- configure TR-069 client
- create rules for remote access to the web-based interface
- enable the UPnP IGD protocol
- edit the VDSL/ADSL connection parameters
- allow the router to use IGMP
- allow the router to use RTSP, enable the SIP ALG, the PPPoE/PPTP/L2TP/IPsec pass through functions for the router.

## Interface Grouping

On the **Advanced / Interface Grouping** page, you can create groups consisting of interfaces and ports of the router, for example, for distinguishing different types of traffic. Such a function is mostly used in Triple-play networks.

The **DEFAULT** group is created in the router's system. You cannot edit or delete this group.

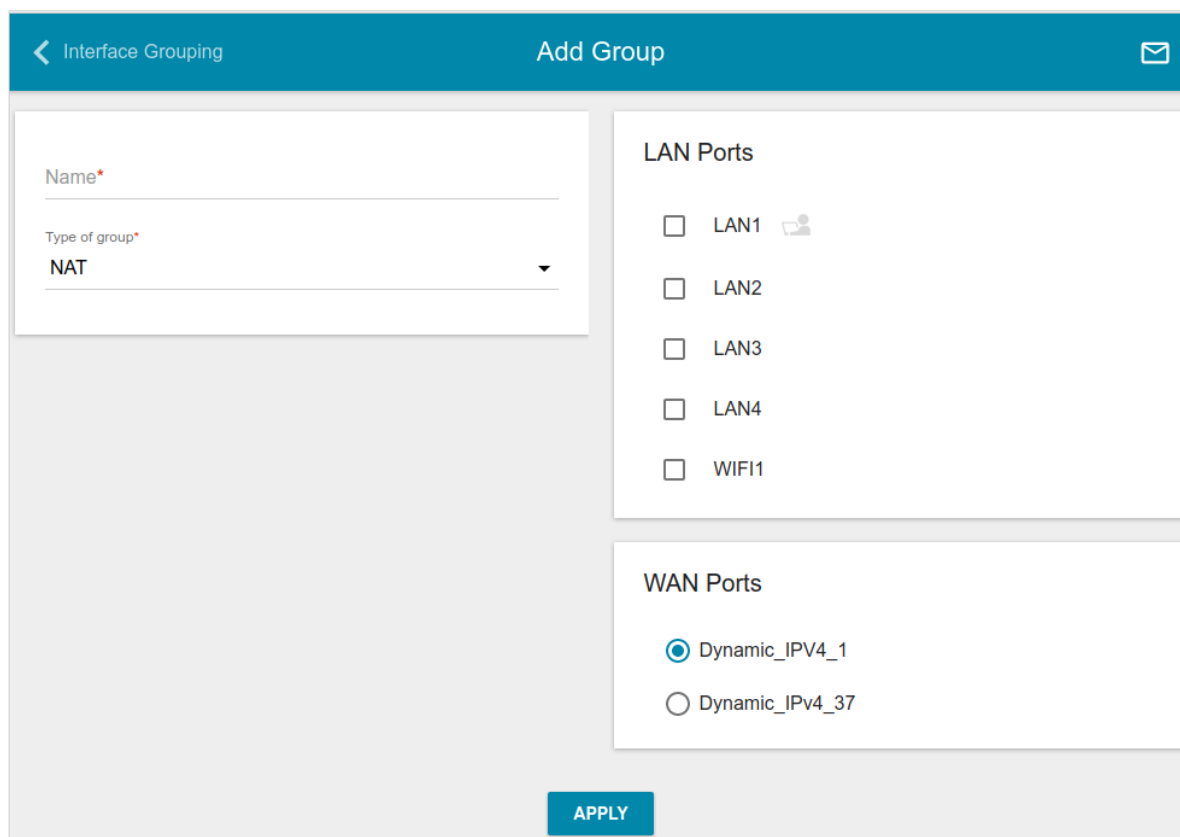

The screenshot shows the 'Interface Grouping' page with a table of groups. The table has columns for Name, Type of group, LAN Ports, and WAN Ports. There is a '+' icon to add a new group and a trash icon to delete a group.

| <input type="checkbox"/> | Name    | Type of group | LAN Ports                     | WAN Ports                       |
|--------------------------|---------|---------------|-------------------------------|---------------------------------|
| <input type="checkbox"/> | DEFAULT | NAT           | LAN1, LAN2, LAN3, LAN4, WIFI1 | Dynamic_IPv4_1, Dynamic_IPv4_37 |

Figure 101. The **Advanced / Interface Grouping** page.

To create a new rule for interface grouping (a group of ports), click the **ADD** button ( **+** ).

The screenshot shows the 'Add Group' page. It has a form with the following fields:

- Name\***: A text input field.
- Type of group\***: A dropdown menu with 'NAT' selected.
- LAN Ports**: A list of checkboxes for LAN1, LAN2, LAN3, LAN4, and WIFI1.
- WAN Ports**: A list of radio buttons for Dynamic\_IPv4\_1 (selected) and Dynamic\_IPv4\_37.
- APPLY**: A blue button at the bottom.

Figure 102. The page for adding a new group of ports.

On the opened page, you can specify the following parameters:

| Parameter            | Description   |
|----------------------|---|
| <b>Name</b>          | A name for the group for easier identification. You can specify any name.   |
| <b>Type of group</b> | The type of the group.<br><b>NAT.</b> The group of this type is an external connection with address translation. It is mostly used to connect to the Internet.<br><b>Transparent bridge.</b> The group of this type is a transparent connection between the router's port and an external connection. It is mostly used to connect IPTV set-top boxes.<br><b>Local.</b> The group of this type is an internal connection of the router's ports. It is mostly used to join devices from the LAN to an isolated network with no access to the Internet. |
| <b>LAN Ports</b>     | In this section the LAN ports and the WLAN interface of the router are displayed.<br>To add an element to the group, select the relevant checkbox.<br>To remove an element from the group, deselect the relevant checkbox.  |
| <b>WAN Ports</b>     | <i>Displayed for the <b>NAT</b> and <b>Transparent bridge</b> types only.</i><br>In this section WAN connections of the router are displayed.<br>To add a connection to the group, select the choice of the radio button which corresponds to this connection.  |

Click the **APPLY** button.

To edit the parameters of a group you created, select the relevant line in the table. On the opened page, change the needed parameters and click the **APPLY** button.

To remove a group you created, select the checkbox located to the left of the relevant line of the table and click the **DELETE** button (  ). Also you can remove a group on the editing page. When you delete a group, ports and interfaces assigned to it are reassigned to the **DEFAULT** group.

## WAN Remapping

On the **Advanced / WAN Remapping** page, you can configure the router to connect to a private Ethernet line.

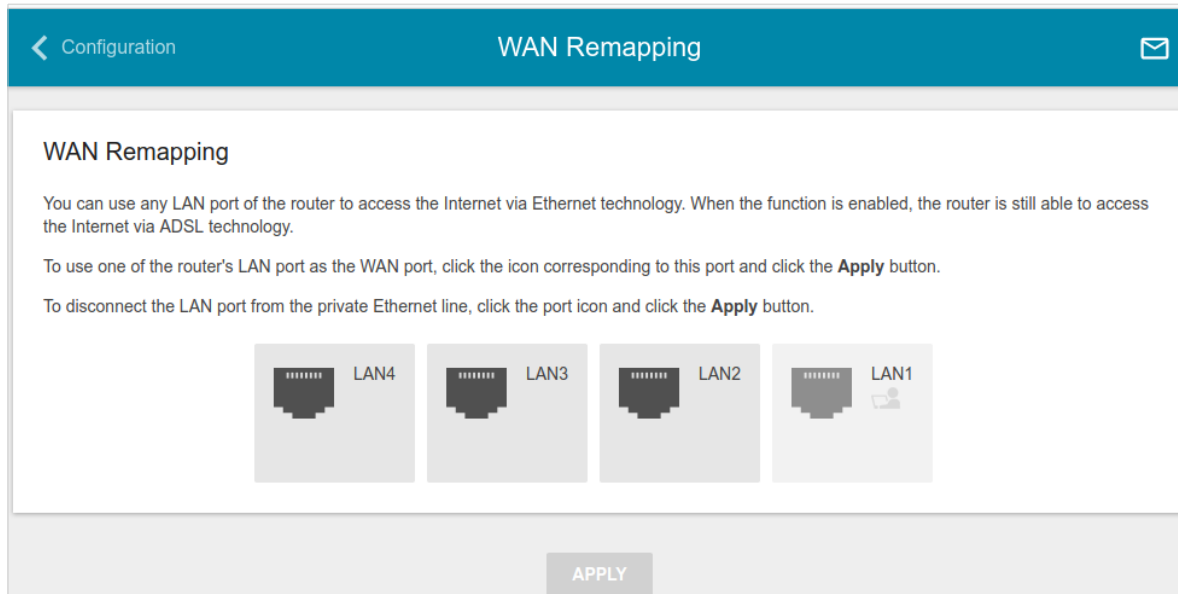

Figure 103. The **Advanced / WAN Remapping** page.

To use one of the router's LAN port as the WAN port, click the icon corresponding to this port and click the **APPLY** button. The port configured as the WAN port is highlighted in teal.

If in the future you need to disconnect the LAN port from the private Ethernet line, click the icon highlighted in teal and click the **APPLY** button.

## DNS

On the **Advanced / DNS** page, you can add DNS servers to the system.

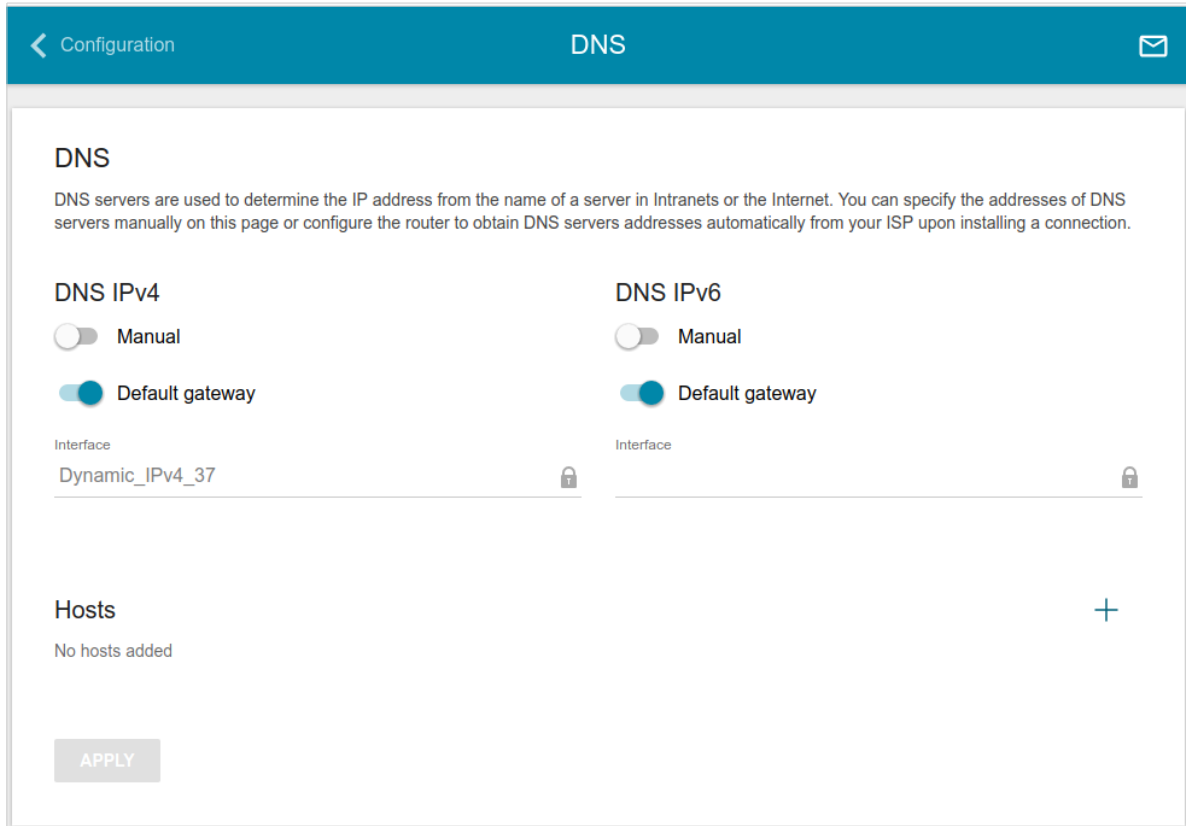

Figure 104. The **Advanced / DNS** page.

DNS servers are used to determine the IP address from the name of a server in Intranets or the Internet (as a rule, they are specified by an ISP or assigned by a network administrator).

You can specify the addresses of DNS servers manually on this page or configure the router to obtain DNS servers addresses automatically from your ISP upon installing a connection.

**!** When you use the built-in DHCP server, the network parameters (including DNS servers) are distributed to clients automatically.

If you want to configure automatic obtainment of DNS servers addresses, move the **Manual** switch to the left (use the **DNS IPv4** section for IPv4 and the **DNS IPv6** section for IPv6). Then move the **Default gateway** switch to the left and from the **Interface** drop-down list select a WAN connection which will be used to obtain addresses of DNS servers automatically. If you want the router to use the default WAN connection to obtain addresses of DNS servers, move the **Default gateway** switch to the right. Then click the **APPLY** button.

To specify a DNS server manually, move the **Manual** switch to the right (use the **DNS IPv4** section for IPv4 and the **DNS IPv6** section for IPv6). In the **Name Servers IPv4** or **Name Servers IPv6** section, click the **ADD SERVER** button, and in the line displayed, enter an IP address of the DNS server. Then click the **APPLY** button.

To remove a DNS server from the page, click the **Delete** icon (✕) in the line of the address and then click the **APPLY** button.

If needed, you can add your own address resource record. To do this, click the **ADD** button (+) in the **Hosts** section.

Figure 105. The window for adding a DNS record.

In the **IP address** field, specify a host from the internal or external network. You can choose a device connected to the router's LAN at the moment. To do this, select the relevant IP address from the drop-down list (the field will be filled in automatically). In the **Name** field, specify the domain name to which the specified IP address will correspond. Click the **SAVE** button.

To edit an existing record, select the relevant line in the table. In the opened window, change the needed parameters and click the **SAVE** button.

To remove a record, in the **Hosts** section, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (🗑).

After completing the work with records, click the **APPLY** button.

## DDNS

On the **Advanced / DDNS** page, you can define parameters of the DDNS service, which allows associating a domain name with dynamic IP addresses.

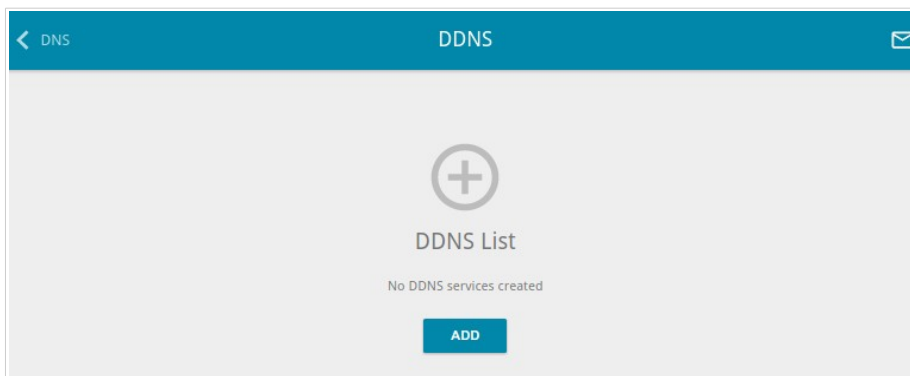

Figure 106. The **Advanced / DDNS** page.

To add a new DDNS service, click the **ADD** button ( **+** ).

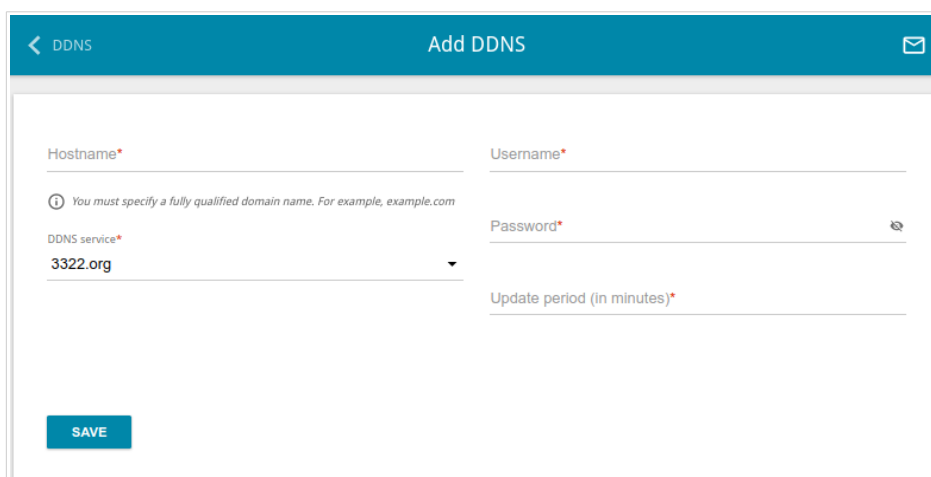

Figure 107. The page for adding a DDNS service.

On the opened page, you can specify the following parameters:

| Parameter            | Description   |
|----------------------|---|
| <b>Hostname</b>      | The full domain name registered at your DDNS provider.  |
| <b>DDNS service</b>  | Select a DDNS provider from the drop-down list.   |
| <b>Username</b>      | The username to authorize for your DDNS provider.   |
| <b>Password</b>      | The password to authorize for your DDNS provider. Click the <b>Show</b> icon (  ) to display the entered password. |
| <b>Update period</b> | An interval (in minutes) between sending data on the router's external IP address to the relevant DDNS service.   |

After specifying the needed parameters, click the **SAVE** button.

To edit parameters of the existing DDNS service, select the relevant line in the table. On the opened page, change the needed parameters and click the **SAVE** button.

To remove an existing DDNS service, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ).

## Routing

On the **Advanced / Routing** page, you can specify static (fixed) routes.

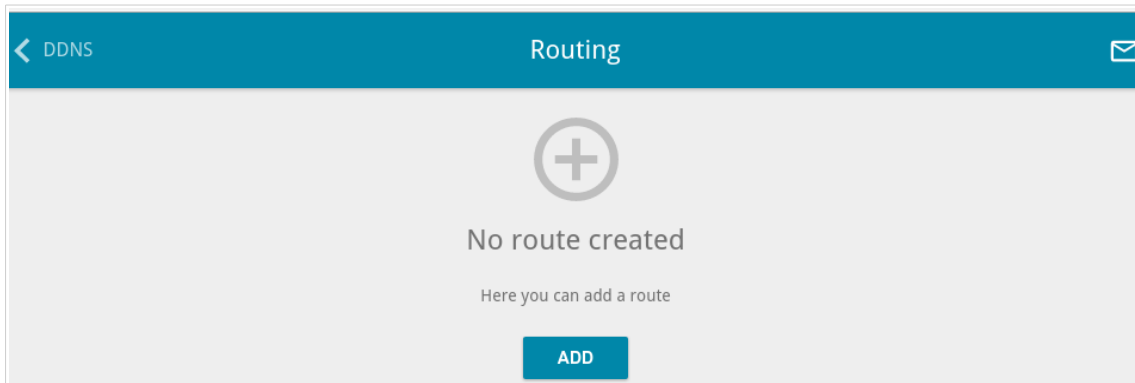

Figure 108. The **Advanced / Routing** page.

To specify a new route, click the **ADD** button (  ).

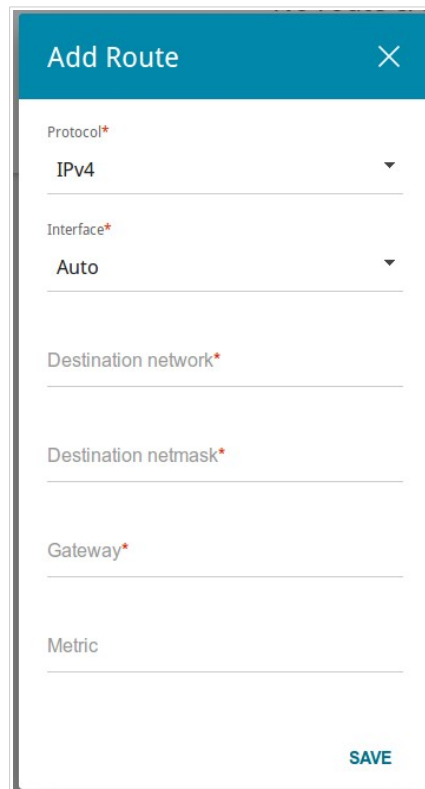

The screenshot shows a modal window titled 'Add Route' with a close button (X) in the top right corner. The window contains several input fields: 'Protocol\*' with a dropdown menu showing 'IPv4'; 'Interface\*' with a dropdown menu showing 'Auto'; 'Destination network\*'; 'Destination netmask\*'; 'Gateway\*'; and 'Metric'. A teal 'SAVE' button is located at the bottom right of the window.

Figure 109. The window for adding a new route.

In the opened window, you can specify the following parameters:

| Parameter                  | Description   |
|----------------------------|---|
| <b>Protocol</b>            | An IP version.  |
| <b>Interface</b>           | From the drop-down list, select an interface (connection) through which the device will communicate with the remote network. If you have selected the <b>Auto</b> value, the router itself sets the interface according to the data on the existing dynamic routes. |
| <b>Destination network</b> | A remote network which can be accessed with help of this route. You can specify an IPv4 or IPv6 address.<br>The format of a host IPv6 address is <b>2001:db8:1234::1</b> , the format of a subnet IPv6 address is <b>2001:db8:1234::/64</b> .                       |
| <b>Destination netmask</b> | <i>For IPv4 protocol only.</i><br>The remote network mask.  |
| <b>Gateway</b>             | An IP address through which the destination network can be accessed.  |
| <b>Metric</b>              | A metric for the route. The lower the value, the higher is the route priority. <i>Optional.</i>   |

After specifying the needed parameters, click the **SAVE** button.

To edit an existing route, select a relevant line of the table. In the opened window, change the needed parameters and click the **SAVE** button.

To remove an existing route, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ).

## TR-069 Client

On the **Advanced / TR-069 Client** page, you can configure the router for communication with a remote Auto Configuration Server (ACS).

The TR-069 client is used for remote monitoring and management of the device.

Figure 110. The page for configuring the TR-069 client.

You can specify the following parameters:

| Parameter                   | Description  |
|-----------------------------|--|
| <b>TR-069 Client</b>        |  |
| <b>Interface</b>            | The interface which the router uses for communication with the ACS. Leave the <b>Automatic</b> value to let the device select the interface basing on the routing table or select another value if required by your ISP. |
| <b>Enable TR-069 Client</b> | Move the switch to the right to enable the TR-069 client.  |

| Parameter                                 | Description   |
|---|---|
| <b>Inform settings</b>                    |   |
| <b>On</b>                                 | Move the switch to the right so the router may send reports (data on the device and network statistics) to the ACS. |
| <b>Interval</b>                           | Specify the time period (in seconds) between sending reports.   |
| <b>Auto Configuration Server Settings</b> |   |
| <b>URL address</b>                        | The URL address of the ACS provided by the ISP.   |
| <b>Username</b>                           | The username to connect to the ACS.   |
| <b>Password</b>                           | The password to connect to the ACS.   |
| <b>Connection Request Settings</b>        |   |
| <b>Username</b>                           | The username used by the ACS to transfer a connection request to the router.  |
| <b>Password</b>                           | The password used by the ACS.   |
| <b>Request port</b>                       | The port used by the ACS. By default, the port <b>8999</b> is specified.  |
| <b>Request path</b>                       | The path used by the ACS.   |

When you have configured the parameters, click the **APPLY** button.

## Remote Access

On the **Advanced / Remote Access** page, you can configure access to the web-based interface of the router. By default, the access from external networks to the router is closed. If you need to allow access to the router from the external network, create relevant rules.

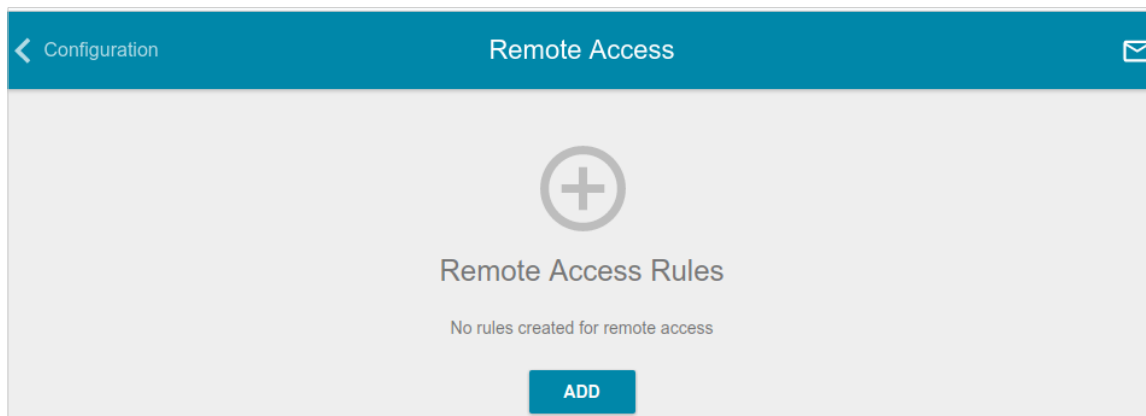

Figure 111. The **Advanced / Remote Access** page.

To create a new rule, click the **ADD** button ( **+** ).

The screenshot shows a modal dialog box titled 'Add Rule' with a close button (X) in the top right corner. The form contains the following fields: 'Name\*' (text input), 'Interface' (dropdown menu with 'Automatic' selected), 'IP version' (dropdown menu with 'IPv4' selected), a toggle switch for 'Open access from any external host' (currently off), 'IP address\*' (text input), 'Mask\*' (text input), 'Public port\*' (text input with '80' entered), and 'Protocol' (dropdown menu with 'HTTP' selected). A 'SAVE' button is located at the bottom right of the dialog.

Figure 112. The window for adding a rule for remote management.

In the opened window, you can specify the following parameters:

| Parameter                                 | Description  |
|---|--|
| <b>Name</b>                               | A name for the rule for easier identification. You can specify any name.   |
| <b>Interface</b>                          | Select a WAN connection to which this rule will be assigned. When the <b>Automatic</b> value is selected, the router uses the default connection.  |
| <b>IP version</b>                         | An IP version to which the rule will be applied. Select the relevant value from the drop-down list.  |
| <b>Open access from any external host</b> | Move the switch to the right to allow access to the router for any host. Upon that the <b>IP address</b> and <b>Mask</b> fields are not displayed. |
| <b>IP address</b>                         | A host or a subnet to which the rule is applied. You can specify an IPv4 or IPv6 address.  |
| <b>Mask</b>                               | <i>For the IPv4-based network only.</i><br>The mask of the subnet.   |
| <b>Public port</b>                        | <i>For the IPv4-based network only.</i><br>An external port of the router. You can specify only one port.  |
| <b>Protocol</b>                           | The protocol available for remote management of the router.  |

After specifying the needed parameters, click the **SAVE** button.

To edit a rule for remote access, left-click the relevant rule. In the opened window, change the needed parameters and click the **SAVE** button.

To remove a rule for remote access, select the checkbox located to the left of the relevant line in the table and click the **DELETE** button (  ).

## UPnP IGD

On the **Advanced / UPnP IGD** page, you can enable the UPnP IGD protocol. The router uses the UPnP IGD protocol for automatic configuration of its parameters for network applications requiring an incoming connection to the router.

Figure 113. The **Advanced / UPnP IGD** page.

If you want to manually specify all parameters needed for network applications, move the **Enable** switch to the left. Then go to the **Firewall / Virtual Servers** page and specify needed settings.

If you want to enable the UPnP IGD protocol in the router, move the **Enable** switch to the right.

When the protocol is enabled, the router's parameters configured automatically are displayed on the page:

| Parameter           | Description  |
|---------------------|--|
| <b>Protocol</b>     | A protocol for network packet transmission.  |
| <b>IP address</b>   | The IP address of a client from the local area network.  |
| <b>Private port</b> | A port of a client's IP address to which traffic is directed from a public port of the router. |
| <b>Public port</b>  | A public port of the router from which traffic is directed to a client's IP address.           |
| <b>Description</b>  | Information transmitted by a client's network application.                                     |

## xDSL

The **Advanced / xDSL** page includes the set of ADSL and VDSL standards that should be defined by an ISP. Contact your ISP to set proper parameters. Select the relevant options and click the **APPLY** button.

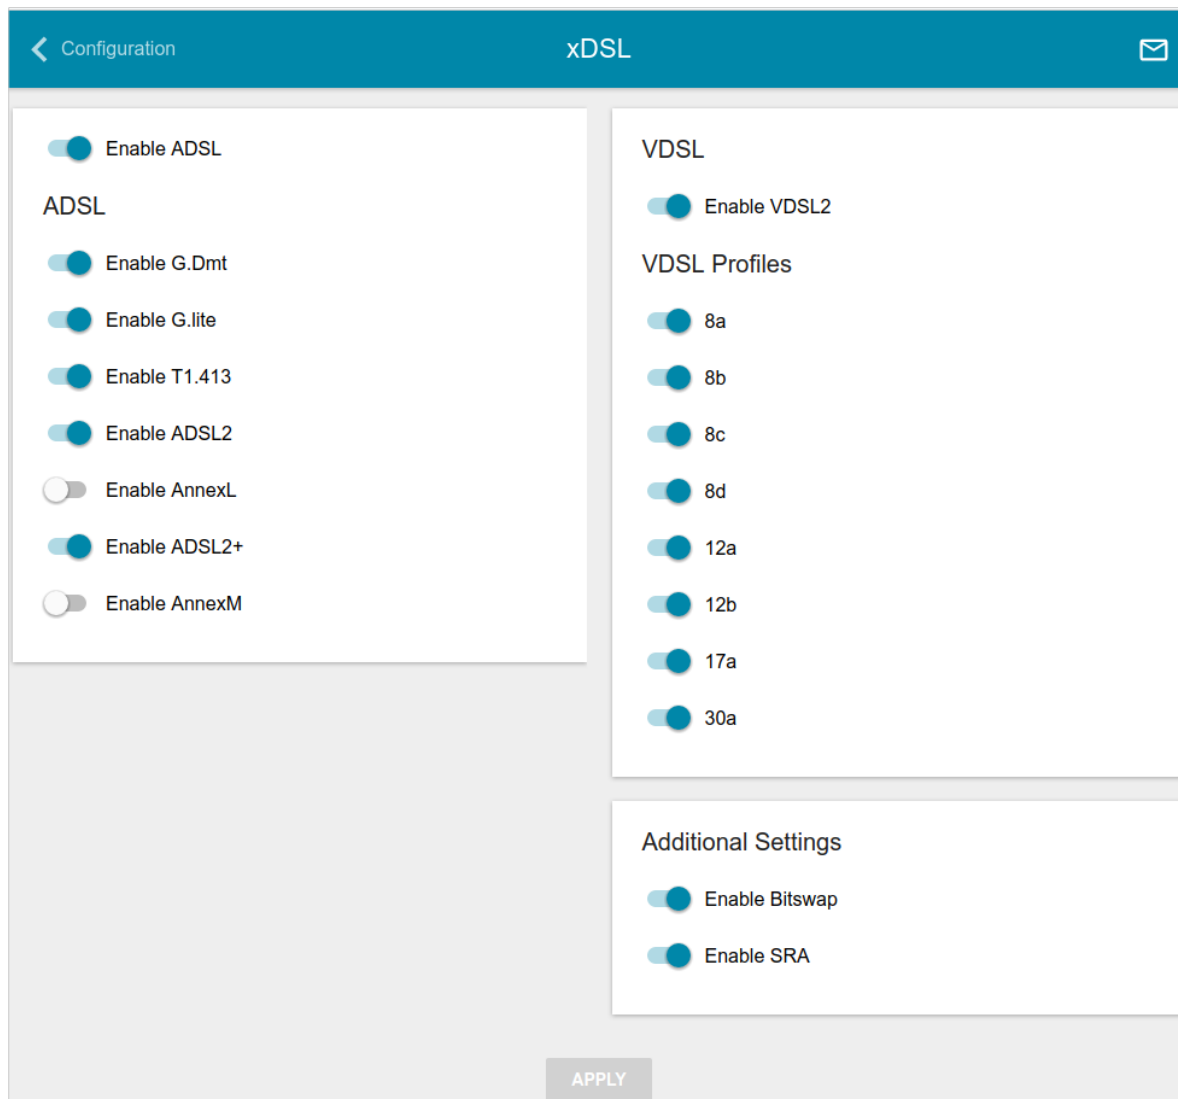

Figure 114. The **Advanced / xDSL** page.

## IGMP

On the **Advanced / IGMP** page, you can allow the router to use IGMP.

IGMP is used for managing multicast traffic (transferring data to a group of destinations). This protocol allows using network resources for some applications, e.g., for streaming video, more efficiently.

Figure 115. The **Advanced / IGMP** page.

The following elements are available on the page:

| Parameter            | Description   |
|----------------------|---|
| <b>Enable</b>        | Move the switch to the right to enable IGMP.  |
| <b>IGMP version</b>  | Select a version of IGMP from the drop-down list.   |
| <b>Interface</b>     | From the drop-down list, select a connection of the Dynamic IPv4 or Static IPv4 type for which you need to allow multicast traffic (e.g. streaming video).  |
| <b>IGMP Snooping</b> | <p>The IGMP snooping function allows limiting multicast traffic for devices connected to the Ethernet ports of the router.</p> <p>If the switch is moved to the right, multicast traffic is forwarded only to the devices which require it.</p> <p>If the switch is moved to the left, multicast traffic is forwarded to all devices connected to the Ethernet ports of the router.</p> |

After specifying the needed parameters, click the **APPLY** button.

## ALG/Passthrough

On the **Advanced / ALG/Passthrough** page, you can allow the router to use RTSP, enable the SIP ALG and PPPoE/PPTP/L2TP/IPsec pass through functions.

SIP is used for creating, modifying, and terminating communication sessions. This protocol allows telephone calls via the Internet.

RTSP is used for real-time streaming multimedia data delivery. This protocol allows some applications to receive streaming audio/video from the Internet.

The PPPoE pass through function allows PPPoE clients of computers from your LAN to connect to the Internet through connections of the router.

The PPTP pass through, L2TP pass through and IPsec pass through functions allow VPN PPTP, L2TP and IPsec traffic to pass through the router so that clients from your LAN can establish relevant connections with remote networks.

Figure 116. The **Advanced / ALG/Passthrough** page.

The following elements are available on the page:

| Parameter                 | Description  |
|---------------------------|--|
| <b>SIP</b>                | Move the switch to the right to enable SIP. Such a setting allows using the SIP ALG function. This function allows VoIP traffic to pass through the NAT-enabled router. <sup>3</sup> |
| <b>RTSP</b>               | Move the switch to the right to enable RTSP. Such a setting allows managing media stream: fast forward streaming audio/video, pause and start it.                                    |
| <b>PPPoE pass through</b> | Move the switch to the right to enable the PPPoE pass through function.  |
| <b>IPsec pass through</b> | Move the switch to the right to enable the IPsec pass through function.  |
| <b>L2TP pass through</b>  | Move the switch to the right to enable the L2TP pass through function.   |
| <b>PPTP pass through</b>  | Move the switch to the right to enable the PPTP pass through function.   |

After specifying the needed parameters, click the **APPLY** button.

---

<sup>3</sup> On the **Connections Setup / WAN** page, create a WAN connection, move the **SIP** switch to the right on the **Advanced / ALG/Passthrough** page, connect an Ethernet cable between a LAN port of the router and the IP phone. Specify SIP parameters on the IP phone and configure it to obtain an IP address automatically (as DHCP client).

## Firewall

In this menu you can configure the firewall of the router:

- add rules for IP filtering
- create virtual servers
- define a DMZ
- configure the MAC filter
- specify restrictions on access to certain web sites.

## IP Filter

On the **Firewall / IP Filter** page, you can create new rules for filtering IP packets and edit or remove existing rules.

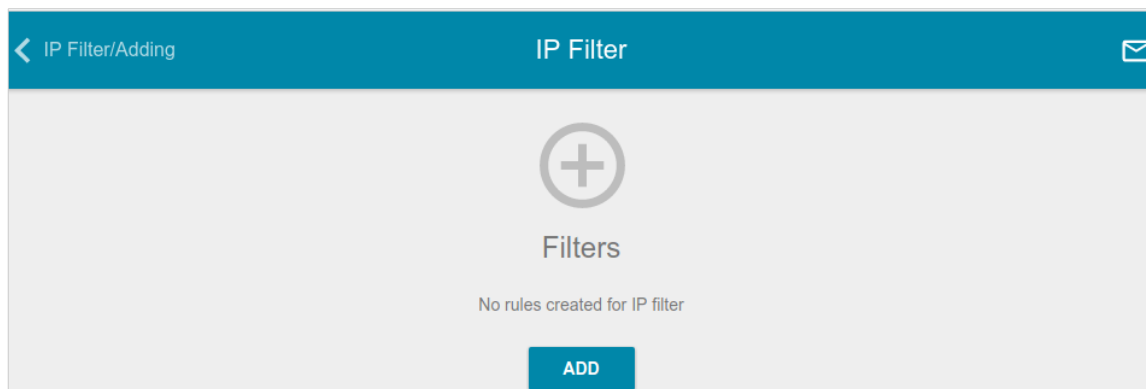

Figure 117. The **Firewall / IP Filter** page.

To create a new rule, click the **ADD** button ( **+** ).

Figure 118. The page for adding a rule for IP filtering.

You can specify the following parameters:

| Parameter               | Description   |
|-------------------------|---|
| <b>General settings</b> |   |
| <b>Enable rule</b>      | Move the switch to the right to enable the rule.<br>Move the switch to the left to disable the rule.  |
| <b>Name</b>             | A name for the rule for easier identification. You can specify any name.  |
| <b>Action</b>           | Select an action for the rule.<br><b>Allow:</b> Allows packet transmission in accordance with the criteria specified by the rule.<br><b>Deny:</b> Denies packet transmission in accordance with the criteria specified by the rule. |

| Parameter  | Description  |
|--|--|
| <b>Protocol</b>                                  | A protocol for network packet transmission. Select a value from the drop-down list.  |
| <b>IP version</b>                                | An IP version to which the rule will be applied. Select the relevant value from the drop-down list.  |
| <b>Source IP Address</b>                         |  |
| <b>Set as</b>                                    | Select the needed value from the drop-down list.   |
| <b>Start IPv4 address / Start IPv6 address</b>   | <p>The source host start IPv4 or IPv6 address.</p> <p>If it is necessary to specify a single address, leave the <b>End IPv4 address / End IPv6 address</b> field blank.</p> <p>You can choose a device connected to the router's LAN at the moment. To do this, select the relevant IPv4 or IPv6 address from the drop-down list (the field will be filled in automatically).</p>      |
| <b>End IPv4 address / End IPv6 address</b>       | The source host end IPv4 or IPv6 address.  |
| <b>Subnet IPv4 address / Subnet IPv6 address</b> | The source subnet IPv4 or IPv6 address. The field is displayed when the <b>Subnet</b> value is selected from the <b>Set as</b> drop-down list.   |
| <b>Destination IP Address</b>                    |  |
| <b>Set as</b>                                    | Select the needed value from the drop-down list.   |
| <b>Start IPv4 address / Start IPv6 address</b>   | <p>The destination host start IPv4 or IPv6 address.</p> <p>If it is necessary to specify a single address, leave the <b>End IPv4 address / End IPv6 address</b> field blank.</p> <p>You can choose a device connected to the router's LAN at the moment. To do this, select the relevant IPv4 or IPv6 address from the drop-down list (the field will be filled in automatically).</p> |
| <b>End IPv4 address / End IPv6 address</b>       | The destination host end IPv4 or IPv6 address.   |
| <b>Subnet IPv4 address / Subnet IPv6 address</b> | The destination subnet IPv4 or IPv6 address. The field is displayed when the <b>Subnet</b> value is selected from the <b>Set as</b> drop-down list.  |
| <b>Ports</b>                                     |  |
| <b>Destination port</b>                          | A port of the destination IP address. You can specify one port, several ports separated by a comma, or a range of ports separated by a colon.  |

| Parameter                       | Description  |
|---------------------------------|--|
| <b>Set source port manually</b> | Move the switch to the right to specify a port of the source IP address manually. Upon that the <b>Source port</b> field is displayed.   |
| <b>Source port</b>              | A port of the source IP address. You can specify one port, several ports separated by a comma, or a range of ports separated by a colon. |

Click the **APPLY** button.

To edit a rule for IP filtering, select the relevant line in the table. On the opened page, change the needed parameters and click the **APPLY** button.

To remove a rule, select the checkbox located to the left of the relevant line of the table and click the **DELETE** button (  ). Also you can remove a rule on the editing page.

## Virtual Servers

On the **Firewall / Virtual Servers** page, you can create virtual servers for redirecting incoming Internet traffic to a specified IP address in the local area network.

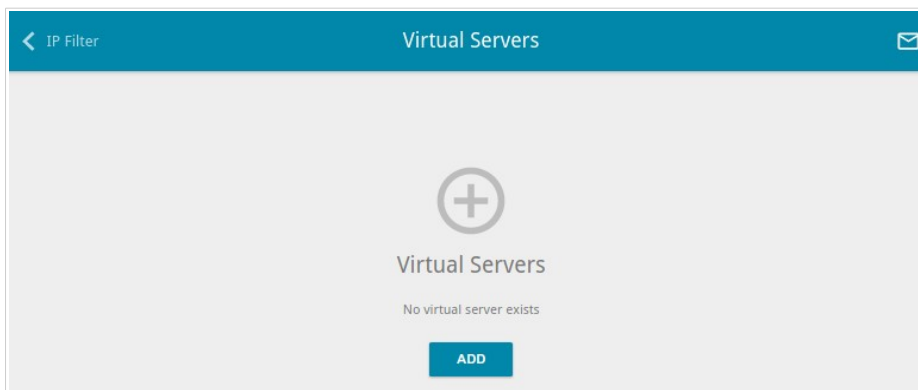

Figure 119. The **Firewall / Virtual Servers** page.

To create a new virtual server, click the **ADD** button (  ).

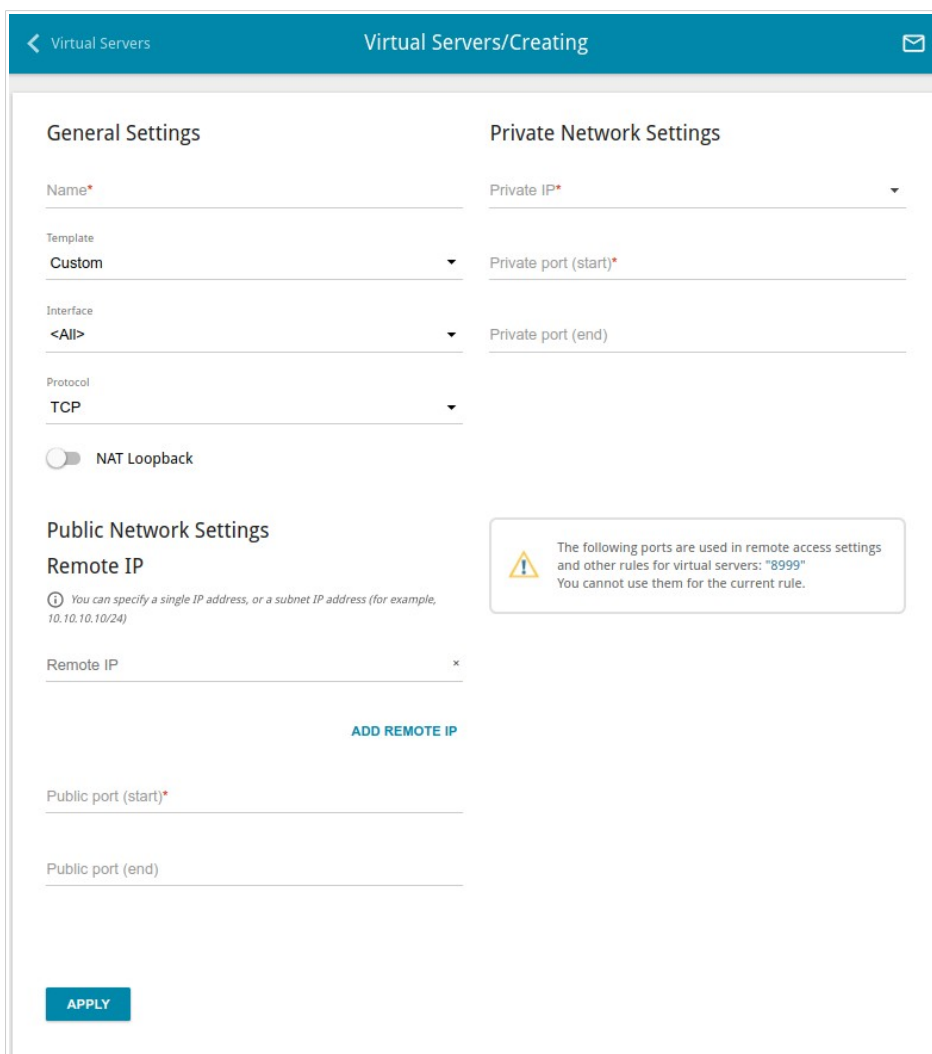

Figure 120. The page for adding a virtual server.

You can specify the following parameters:

| Parameter   | Description  |
|---|--|
| <b>General Settings</b>                           |  |
| <b>Name</b>                                       | A name for the virtual server for easier identification. You can specify any name.   |
| <b>Template</b>                                   | Select a virtual server template from the drop-down list, or select <b>Custom</b> to specify all parameters of the new virtual server manually.  |
| <b>Interface</b>                                  | A WAN connection to which this virtual server will be assigned.  |
| <b>Protocol</b>                                   | A protocol that will be used by the new virtual server. Select a value from the drop-down list.  |
| <b>NAT Loopback</b>                               | Move the switch to the right in order to let the users of the router's LAN access the local server using the external IP address of the router or its DDNS name (if a DDNS service is configured). Users from the external network access the router using the same address (or DDNS name).  |
| <b>Public Network Settings</b>                    |  |
| <b>Remote IP</b>                                  | <p>The IP address of the host/subnet of the client that will connect to the virtual server.</p> <p>To add one more IP address, click the <b>ADD REMOTE IP</b> button and enter the address in the displayed line.</p> <p>To remove the IP address, click the <b>Delete</b> icon (✕) in the line of the address.</p>  |
| <b>Public port (start)/<br/>Public port (end)</b> | A port of the router from which traffic is directed to the IP address specified in the <b>Private IP</b> field in the <b>Private Network Settings</b> section. Specify the start and the end value for the port range. If you need to specify one port, enter the needed value in the <b>Public port (start)</b> field and leave the <b>Public port (end)</b> field blank. |
| <b>Private Network Settings</b>                   |  |
| <b>Private IP</b>                                 | The IP address of the server from the local area network. To choose a device connected to the router's LAN at the moment, select the relevant value from the drop-down list (the field will be filled in automatically).   |

| Parameter   | Description  |
|---|--|
| <b>Private port (start)/<br/>Private port (end)</b> | A port of the IP address specified in the <b>Private IP</b> field to which traffic is directed from the <b>Public port</b> . Specify the start and the end value for the port range. If you need to specify one port, enter the needed value in the <b>Private port (start)</b> field and leave the <b>Private port (end)</b> field blank. |

Click the **APPLY** button.

To edit the parameters of an existing server, select the relevant line in the table. On the opened page, change the needed parameters and click the **APPLY** button.

To remove a server, select the checkbox located to the left of the relevant line of the table and click the **DELETE** button (  ). Also you can remove a server on the editing page.

## DMZ

A DMZ is a host or network segment located “between” internal (local) and external (global) networks. In the router, the DMZ implements the capability to transfer a request coming to a port of the router from the external network to a specified host of the internal network.

On the **Firewall / DMZ** page, you can specify the IP address of the DMZ host.

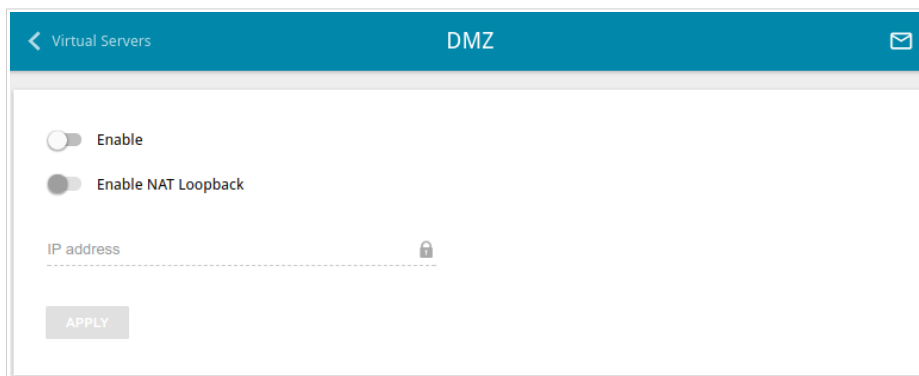

Figure 121. The **Firewall / DMZ** page.

To enable the DMZ, move the **Enable** switch to the right.

Enter the IP address of a host from your network in the **IP address** field. To choose a device connected to the router's LAN at the moment, select the relevant value from the drop-down list (the field will be filled in automatically).

Move the **Enable NAT Loopback** switch to the right in order to let the users of the router's LAN access the DMZ host using the external IP address of the router or its DDNS name (if a DDNS service is configured). Users from the external network access the router using the same address (or DDNS name).

Click the **APPLY** button.

Note that when the DMZ is enabled, all traffic coming to a port of the WAN interface of the router is directed to the same port of the specified IP address. Also note that virtual servers have higher priority than the DMZ host. In other words, if there has been created a virtual server that directs traffic from external port 80 to a port of the device from the router's local network, then entering **http://router\_WAN\_IP** in the address bar, users of the external network are directed to the specified port and IP address configured for the virtual server, but not to port 80 of the device with the IP address specified on the **Firewall / DMZ** page.

To disable the DMZ, move the **Enable** switch to the left and click the **APPLY** button.

## MAC Filter

On the **Firewall / MAC Filter** page, you can configure MAC-address-based filtering for computers of the router's LAN.

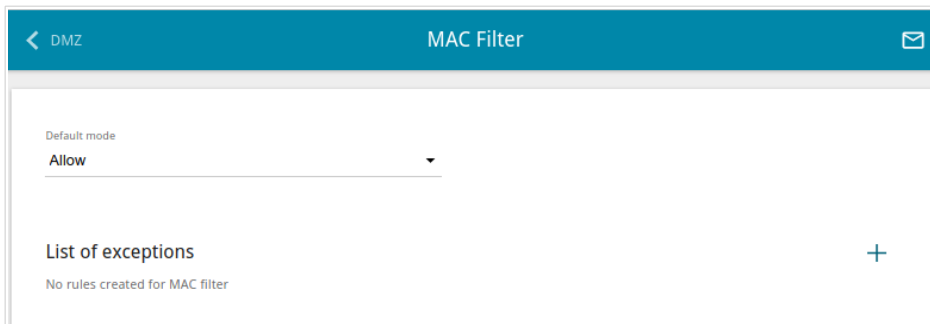

Figure 122. The **Firewall / MAC Filter** page.

Select the needed action from the drop-down list in the **Default mode** section to configure filtering for all devices of the router's network:

- **Allow**: Allows access to the router's network and to the Internet for devices (the value is specified by default);
- **Deny**: Blocks access to the router's network for devices.

**!** You can use the **Deny** mode only if an active rule which allows access to the device's network is created on the page.

To create a rule (specify a MAC address of a device for which the specified filtering mode will be applied), click the **ADD** button ( **+** ).

Figure 123. The window for adding a rule for the MAC filter.

In the opened window, you can specify the following parameters:

| Parameter          | Description   |
|--------------------|---|
| <b>Enable rule</b> | Move the switch to the right to enable the rule.<br>Move the switch to the left to disable the rule.  |
| <b>Action</b>      | Select an action for the rule.<br><b>Deny:</b> Blocks access to the Internet for the device with the specified MAC address even if the default mode allows access for all devices.<br><b>Allow:</b> Allows access to the router's network and to the Internet for the device with the specified MAC address even if the default mode denies access for all devices. |
| <b>MAC address</b> | The MAC address of a device from the router's LAN. You can enter the MAC address of a device connected to the router's LAN at the moment. To do this, select the relevant device from the drop-down list (the field will be filled in automatically).   |
| <b>Hostname</b>    | The name of the device for easier identification. You can specify any name.   |

After specifying the needed parameters, click the **SAVE** button.

To edit a rule, select the relevant line in the table. In the opened window, change the needed parameters and click the **SAVE** button.

To remove a rule, select the checkbox located to the left of the relevant line of the table and click the **DELETE** button (  ). Also you can remove a rule in the editing window.

## URL Filter

On the **Firewall / URL Filter** page, you can specify restrictions on access to certain web sites.

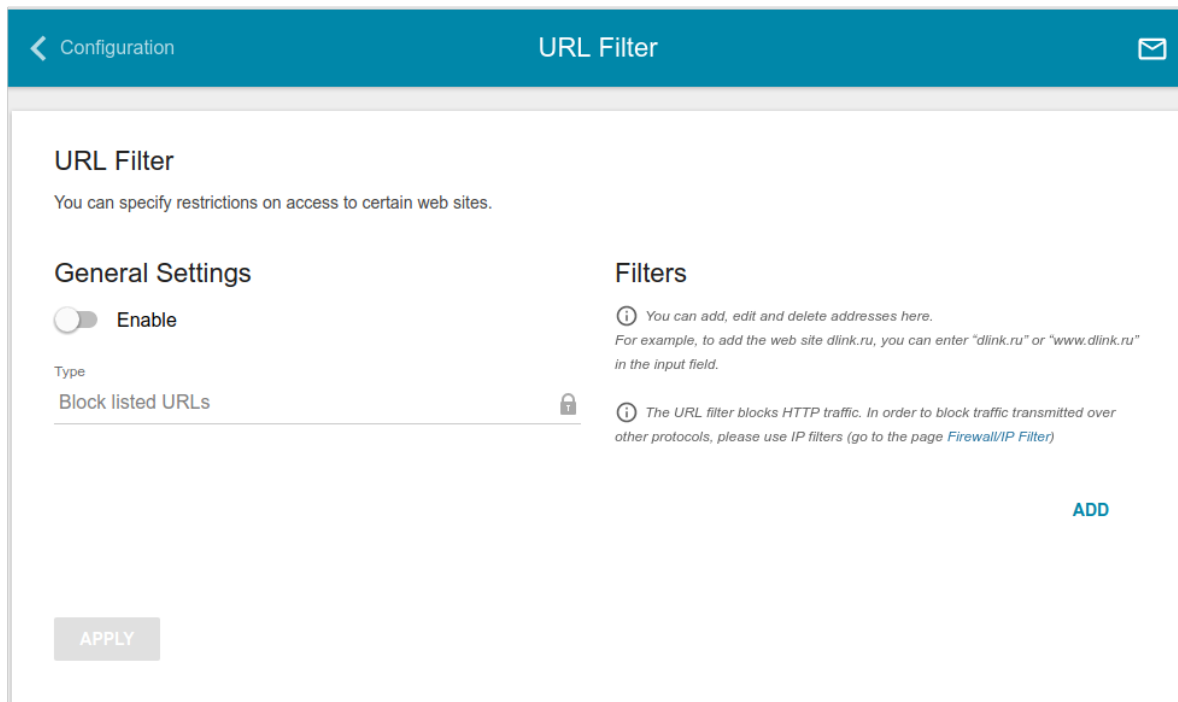

Figure 124. The **Firewall / URL Filter** page.

To enable the URL filter, in the **General Settings** section, move the **Enable** switch to the right, then select the needed mode from the **Type** drop-down list:

- **Block listed URLs:** when this value is selected, the router blocks access to all addresses specified in the **Filters** section;
- **Block all URLs except listed:** when this value is selected, the router allows access to addresses specified in the **Filters** section and blocks access to all other web sites.

Click the **APPLY** button.

To specify URL addresses to which the selected filtering mode will be applied, in the **Filters** section, click the **ADD** button and enter a relevant address in the displayed line. Then click the **APPLY** button.

To remove an address from the list of URL addresses, click the **Delete** icon (✕) in the line of the relevant URL address. Then click the **APPLY** button.

## System

In this menu you can do the following:

- change the password used to access the router's settings
- restore the factory default settings
- create a backup of the router's configuration
- restore the router's configuration from a previously saved file
- save the current settings to the non-volatile memory
- reboot the router
- change the web-based interface language
- update the firmware of the router
- configure automatic notification on new firmware version
- view the system log; configure sending the system log to a remote host
- check availability of a host on the Internet through the web-based interface of the router
- trace the route to a host
- allow or forbid access to the router via TELNET
- configure automatic synchronization of the system time or manually configure the date and time for the router.

## Configuration

On the **System / Configuration** page, you can change the password for the administrator account used to access the web-based interface of the router and to access the device settings via TELNET, restore the factory defaults, backup the current configuration, restore the router's configuration from a previously created file, save the changed settings to the non-volatile memory, reboot the device, or change the web-based interface language.

Figure 125. The **System / Configuration** page.

In order to change the password for the administrator account, in the **User** section, enter a new password in the **New password** and **Password confirmation** fields. Use digits, Latin letters (uppercase and/or lowercase), and other characters available in the US keyboard layout.<sup>4</sup> Click the **Show** icon (👁) to display the entered values. Then click the **SAVE** button.

Remember or write down the new password for the administrator account. In case of losing the new password, you can access the settings of the router only after restoring the factory default settings via the hardware **RESET** button. This procedure wipes out all settings that you have configured for your router.

To change the web-based interface language, select the needed value from the **Language** drop-down list.

<sup>4</sup> 0-9, A-Z, a-z, space, !"#%&'()\*+,-./:;<=>?@[\\]^\_`{|}~.

The following buttons are also available on the page:

| Control        | Description   |
|----------------|---|
| <b>Factory</b> | Click the button to restore the factory default settings. Also you can restore the factory defaults via the hardware <b>RESET</b> button (see the <i>Side Panel</i> section, page 10).  |
| <b>Backup</b>  | Click the button to save the configuration (all settings of the router) to your PC. The configuration backup will be stored in the download location of your web browser.   |
| <b>Restore</b> | Click the button and follow the dialog box appeared to select a previously saved configuration file (all settings of the router) located on your PC and upload it.  |
| <b>Save</b>    | Click button to save settings to the non-volatile memory.<br>The router saves changed settings automatically. If changed settings have not been saved automatically, a notification is displayed in the top right part of the page. |
| <b>Reboot</b>  | Click the button to reboot the device. All unsaved changes will be lost after the device's reboot.  |

In the **Idle time** field specify a period of inactivity (in minutes) after which the router completes the session of the interface. By default, the value **5** is specified. Then click the **SAVE** button.

## Firmware Update

On the **System / Firmware Update** page, you can update the firmware of the router and configure the automatic check for updates of the router's firmware.

**!** Update the firmware only when the router is connected to your PC via a wired connection.

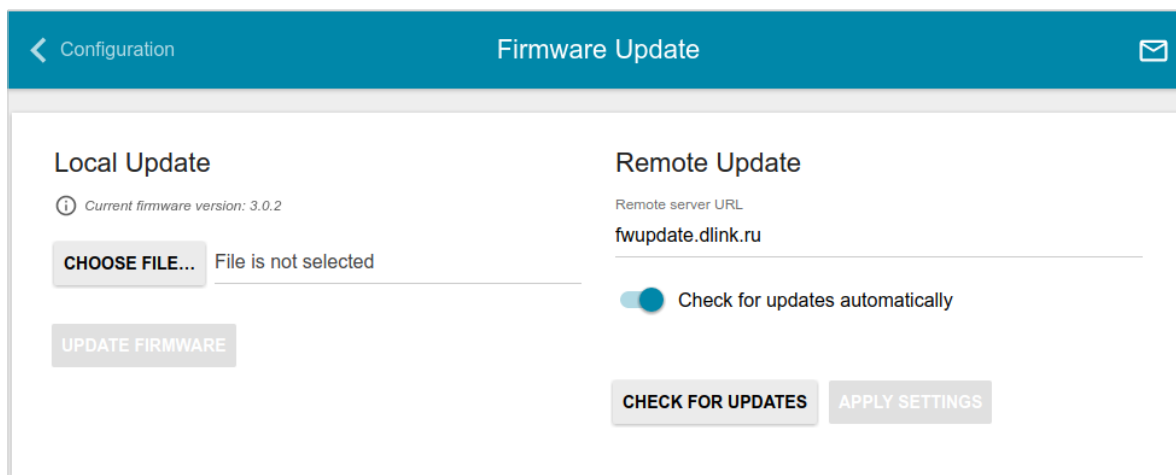

Figure 126. The **System / Firmware Update** page.

The current version of the router's firmware is displayed in the **Current firmware version** field.

By default, the automatic check for the router's firmware updates is enabled. If a firmware update is available, a notification will be displayed in the top right corner of the page.

To disable the automatic check for firmware updates, in the **Remote Update** section, move the **Check for updates automatically** switch to the left and click the **APPLY SETTINGS** button.

To enable the automatic check for firmware updates, in the **Remote Update** section, move the **Check for updates automatically** switch to the right and click the **APPLY SETTINGS** button. By default, in the **Remote server URL** field, the D-Link update server address (`fwupdate.dlink.ru`) is specified.

You can update the firmware of the router locally (from the hard drive of your PC) or remotely (from the update server).

## Local Update

Attention! Do not turn off the router before the firmware update is completed. This may cause the device breakdown.

To update the firmware of the router locally, follow the next steps:

1. Download a new version of the firmware from [www.dlink.ru](http://www.dlink.ru).
2. Click the **CHOOSE FILE** button in the **Local Update** section on the **System / Firmware Update** page to locate the new firmware file.
3. Click the **UPDATE FIRMWARE** button.
4. Wait until the router is rebooted (about one and a half or two minutes).
5. Log into the web-based interface using the login (**admin**) and the current password.

If after updating the firmware the router doesn't work correctly, please restore the factory default settings. To do this, click the **Factory** button on the **System / Configuration** page. Wait until the router is rebooted.

## Remote Update

Attention! Do not turn off the router before the firmware update is completed. This may cause the device breakdown.

To update the firmware of the router remotely, follow the next steps:

1. On the **System / Firmware Update** page, in the **Remote Update** section, click the **CHECK FOR UPDATES** button to check if a newer firmware version exists.
2. Click the **UPDATE FIRMWARE** button (the button is displayed if a newer version of the firmware is available).
3. Wait until the router is rebooted (about one and a half or two minutes).
4. Log into the web-based interface using the login (**admin**) and the current password.

If after updating the firmware the router doesn't work correctly, please restore the factory default settings. To do this, click the **Factory** button on the **System / Configuration** page. Wait until the router is rebooted.

## Log

On the **System / Log** page, you can set the system log options and configure sending the system log to a remote host.

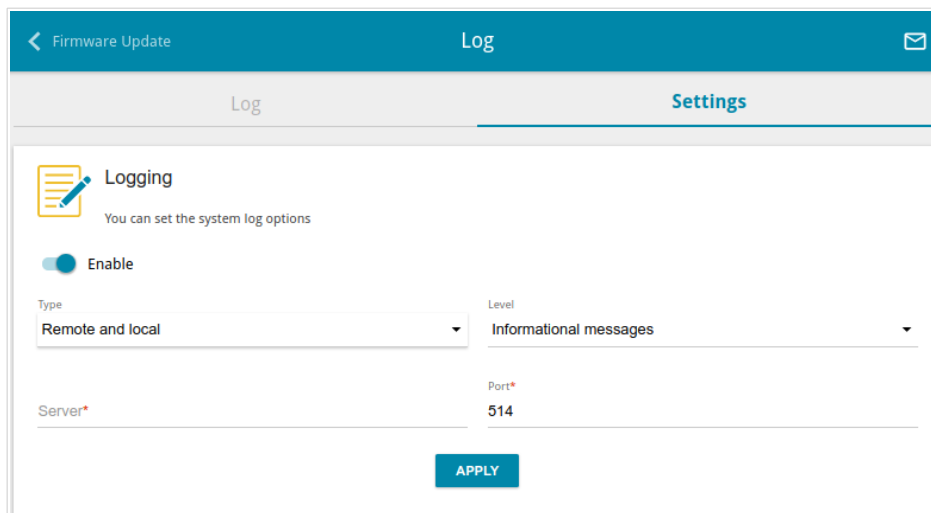

Figure 127. The **System / Log** page. The **Settings** tab.

To enable logging of the system events, go to the **Settings** tab and move the **Enable** switch to the right. Then specify the needed parameters.

| Parameter     | Description  |
|---------------|--|
| <b>Type</b>   | <p>Select a type of logging from the drop-down list.</p> <ul style="list-style-type: none"> <li>• <b>Local</b>: the system log is stored in the router's memory. When this value is selected, the <b>Server</b> and <b>Port</b> fields are not displayed.</li> <li>• <b>Remote</b>: the system log is sent to the remote host specified in the <b>Server</b> field.</li> <li>• <b>Remote and local</b>: the system log is stored in the router's memory and sent to the remote host specified in the <b>Server</b> field.</li> </ul> |
| <b>Level</b>  | Select a type of messages and alerts/notifications to be logged.   |
| <b>Server</b> | The IP or URL address of the host from the local or global network, to which the system log will be sent.  |
| <b>Port</b>   | A port of the host specified in the <b>Server</b> field. By default, the value <b>514</b> is specified.  |

After specifying the needed parameters, click the **APPLY** button.

To disable logging of the system events, move the **Enable** switch to the left and click the **APPLY** button.

To view the system log, go to the **Log** tab.

Figure 128. The **System / Log** page. The **Log** tab.

To view the latest system events, click the **REFRESH** button.

To save the system log to your PC, click the **EXPORT** button. The file will be stored in the download location of your web browser.

## Ping

On the **System / Ping** page, you can check availability of a host from the local or global network via the Ping utility.

The Ping utility sends echo requests to a specified host and receives echo replies.

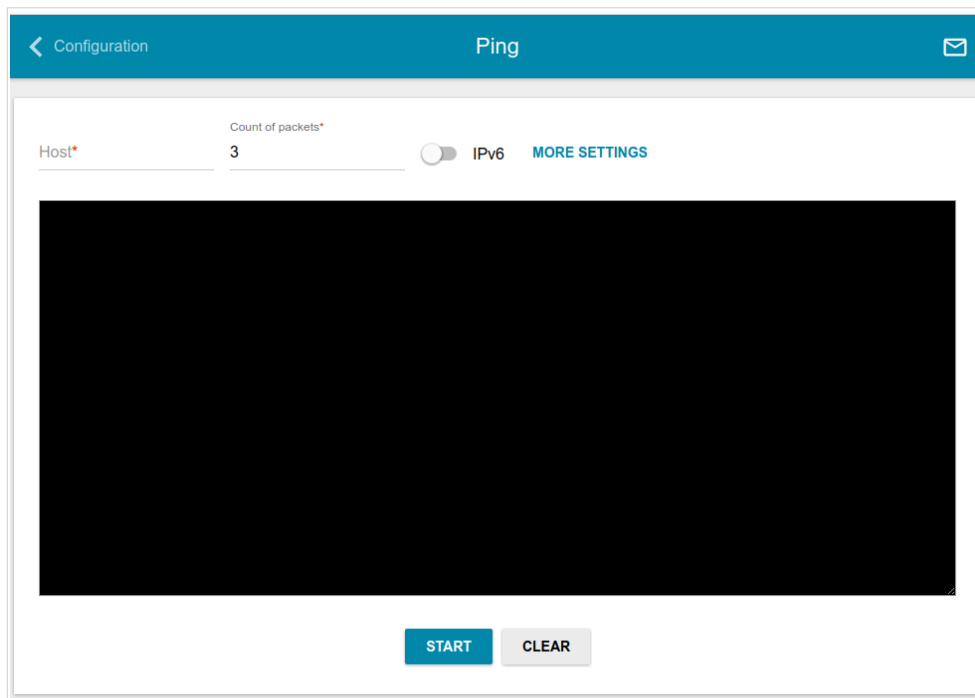

Figure 129. The **System / Ping** page.

To check availability of a host, enter the IP address or name of this host in the **Host** field and specify a number of requests that will be sent in order to check its availability in the **Count of packets** field. If availability check should be performed with IPv6, move the **IPv6** switch to the right.

To specify additional settings, click the **MORE SETTINGS** button.

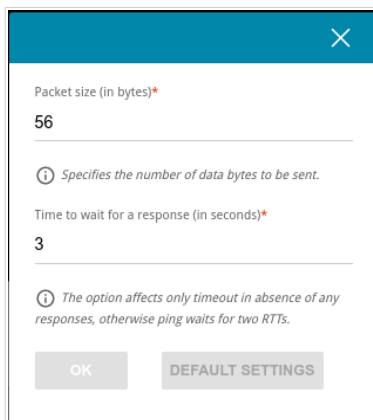

Figure 130. The **System / Ping** page. The additional settings window.

In the opened window, in the **Packet size** field, specify the volume of data sent in a request. In the **Time to wait for a response** field, specify the response waiting period in seconds. To restore the default field values, click the **DEFAULT SETTINGS** button.

After specifying the additional parameters, click the **OK** button.

To run the check, click the **START** button. After a while, the results will be displayed on the page.

To remove the check result from the page, click the **CLEAR** button.

## Traceroute

On the **System / Traceroute** page, you can determine the route of data transfer to a host via the traceroute utility.

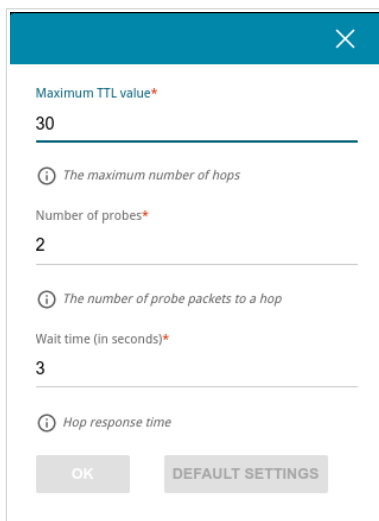

Figure 131. The **System / Traceroute** page.

To determine the route, enter the name or IP address of a host in the **Host** field. If the route should be determined using IPv6, move the **IPv6** switch to the right.

To specify additional settings, click the **MORE SETTINGS** button.

Maximum TTL value\*  
30  
 ⓘ The maximum number of hops

Number of probes\*  
2  
 ⓘ The number of probe packets to a hop

Wait time (in seconds)\*  
3  
 ⓘ Hop response time

OK    DEFAULT SETTINGS

Figure 132. The **System / Traceroute** page. The additional settings window.

In the opened window, you can specify the following parameters:

| Parameter                | Description   |
|--------------------------|---|
| <b>Maximum TTL value</b> | Specify the TTL ( <i>Time to live</i> ) parameter value. The default value is <b>30</b> . |
| <b>Number of probes</b>  | The number of attempts to hit an intermediate host.                                       |
| <b>Wait time</b>         | A period of waiting for an intermediate host response.                                    |

To restore the default field values, click the **DEFAULT SETTINGS** button.

After specifying the additional parameters, click the **OK** button.

To run the check, click the **START** button. After a while, the results will be displayed on the page.

To remove the check result from the page, click the **CLEAR** button.

## Telnet

On the **System / Telnet** page, you can enable or disable access to the device settings via TELNET from your LAN. By default, access is disabled.

Figure 133. The **System / Telnet** page.

To enable access via TELNET, move the **Enable Telnet** switch to the right. In the **Port** field, enter the number of the router's port through which access will be allowed (by default, the port **23** is specified). Then click the **APPLY** button.

To disable access via TELNET again, move the **Enable Telnet** switch to the left and click the **APPLY** button.

## System Time

On the **System / System Time** page, you can manually set the time and date of the router or configure automatic synchronization of the system time with a time server on the Internet.

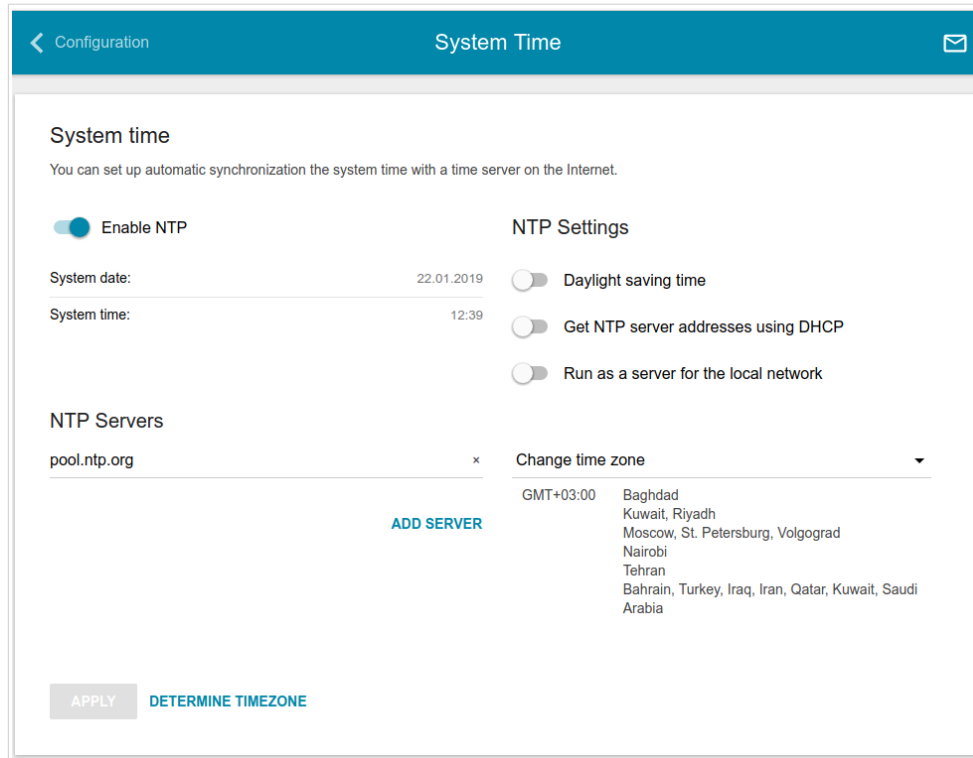

Figure 134. The **System / System Time** page.

To set the system time manually, follow the next steps:

1. Move the **Enable NTP** switch to the left.
2. In the **Time Settings** section, specify needed values. To specify the time set up your PC or portable device, click the **SET LOCAL TIME** button.
3. Click the **APPLY** button. The **System date** and **System time** fields will be filled in automatically.

To enable automatic synchronization with a time server, follow the next steps:

1. Move the **Enable NTP** switch to the right.
2. Specify the needed NTP server or leave the value specified by default in the **NTP Servers** section. If you need to specify several servers, click the **ADD SERVER** button.
3. Select your time zone from the **Change time zone** drop-down list in the **NTP Settings** section. To set the time zone in accordance with the settings of your operating system or portable device, click the **DETERMINE TIMEZONE** button.
4. Click the **APPLY** button. The **System date** and **System time** fields will be filled in automatically.

To enable automatic adjustment for daylight saving time of the router, move the **Daylight saving time** switch to the right in the **NTP Settings** section and click the **APPLY** button.

In some cases NTP servers addresses are provided by your ISP. In this case, you need to move the **Get NTP server addresses using DHCP** switch in the **NTP Settings** section to the right and click the **APPLY** button. Contact your ISP to clarify if this setting needs to be enabled. If the **Get NTP server addresses using DHCP** switch is moved to the right, the **NTP Servers** section is not displayed.

To allow connected devices to use the IP address of the router in the local subnet as a time server, move the **Run as a server for the local network** switch to the right and click the **APPLY** button.

When the router is powered off or rebooted, the system time is reset to the default value. If you have set automatic synchronization for the system time, the internal clock of the device will be configured after connecting to the Internet. If you have set the system time manually, you need to set the time and date again (see above).

## Yandex.DNS

This menu is designed to configure the Yandex.DNS service.

Yandex.DNS is a web content filtering service which provides the DNS server, protects a computer against malicious web sites, and blocks access to adult web sites.

## Settings

On the **Yandex.DNS / Settings** page, you can enable the Yandex.DNS service and configure its operating mode.

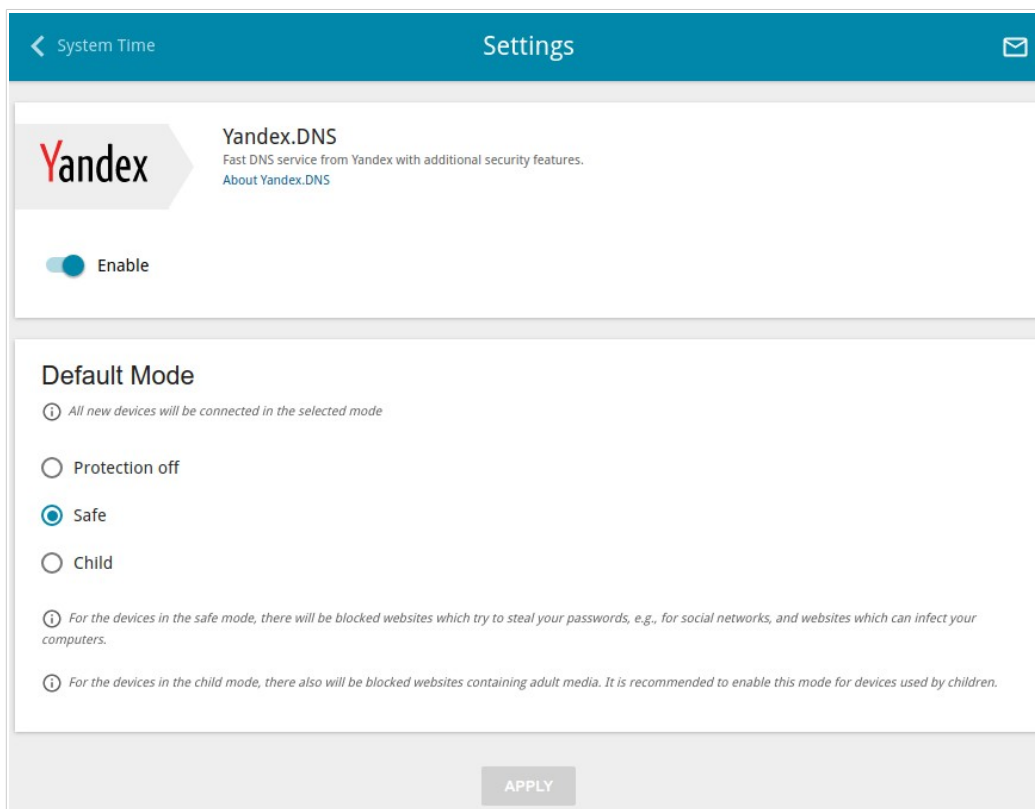

Figure 135. The **Yandex.DNS / Settings** page.

To get detailed information on the service, click the **About Yandex.DNS** link.

To enable the Yandex.DNS service, move the **Enable** switch to the right.

When the service is enabled, the **Default mode** section is displayed on the page. Select the needed choice of the radio button to configure filtering for all devices of the router's network:

- **Protection off:** when this value is selected, the service provides the DNS server with no restrictions on access to unsafe web sites;
- **Safe:** when this value is selected, the service blocks access to malicious and fraudulent web sites;
- **Child:** when this value is selected, the service blocks access to malicious and fraudulent web sites and blocks access to adult content.

Also the selected filtering mode will be applied to all devices newly connected to the router's network.

After specifying all needed parameters, click the **APPLY** button.

To disable the Yandex.DNS service, move the **Enable** switch to the left and click the **APPLY** button.

## Devices and Rules

On the **Yandex.DNS / Devices and Rules** page, you can specify a filtering mode for each device separately.

Figure 136. The **Yandex.DNS / Devices and Rules** page.

In the **Known Clients** section, the devices connected to the local network of the router at the moment and their relevant filtering mode are displayed.

To create<sup>5</sup> a new filtering rule for a device, click the **ADD** button ( **+** ) in the **Rules** section, or left-click the name of the filtering mode in the line of the device for which a rule should be created in the **Known Clients** section.

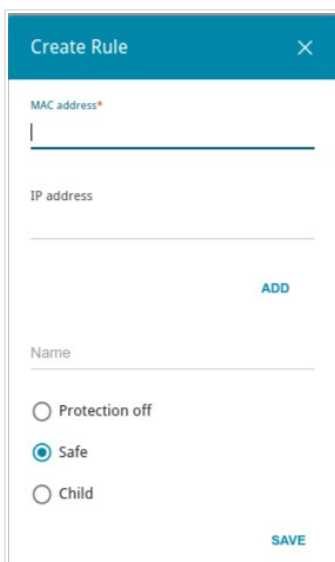

Figure 137. Adding a new rule for the **Yandex.DNS** service.

<sup>5</sup> When a new rule for filtering is created, a MAC address and IP address pair is displayed on the **Connections Setup / LAN** page. The created pair will be deleted with the relevant rule.

In the opened window, you can specify the following parameters:

| Parameter          | Description   |
|--------------------|---|
| <b>MAC address</b> | The MAC address of a device from the router's LAN.  |
| <b>IP address</b>  | <p>The IP address of a device from the router's LAN.</p> <p>To assign several fixed IP addresses to a device with a certain MAC address, click the <b>ADD</b> button, and in the line displayed, enter an IP address. A device of your LAN can have one IPv4 address and several IPv6 addresses.</p> <p>To remove the IP address, click the <b>Delete</b> icon (✕) in the line of the address.</p>  |
| <b>Name</b>        | Enter a name for the rule for easier identification. <i>Optional.</i>   |
| <b>Mode</b>        | <p>Select an operating mode of the Yandex.DNS service for this rule.</p> <p><b>Protection off:</b> when this value is selected, the service provides the DNS server with no restrictions on access to unsafe web sites.</p> <p><b>Safe:</b> when this value is selected, the service blocks access to malicious and fraudulent web sites.</p> <p><b>Child:</b> when this value is selected, the service blocks access to malicious and fraudulent web sites and blocks access to adult content.</p> |

After specifying the needed parameters, click the **SAVE** button.

To edit a rule for filtering, select a relevant line of the table, in the opened window, change the needed values and click the **SAVE** button.

To remove a rule for filtering, select the checkbox located to the left of the relevant rule and click the **DELETE** button (🗑️). Also you can remove a rule in the editing window.

After completing the work with rules, click the **APPLY** button.

## CHAPTER 5. OPERATION GUIDELINES

### ***Safety Rules and Conditions***

Please carefully read this section before installation and connection of the device. Make sure that the power adapter and cables are not damaged. The device should be used only as intended in accordance with the documents.

The device is intended for use in dry, clean, dust-free, and well ventilated areas with normal humidity away from strong heat sources. Do not use the device outdoors or in the areas with high humidity. Do not place foreign objects on the device. Do not obstruct the ventilation openings of the device. The environmental temperature near the device and the temperature inside the device's cover should be within the range from 0 °C to +40 °C.

Only use the power adapter supplied with the device. Do not plug in the adapter, if its case or cable are damaged. Plug the adapter only into working electrical outlets with parameters indicated on the adapter.

Do not open the cover of the device! Unplug the device before dusting and cleaning. Use a damp cloth to clean the device. Do not use liquid/aerosol cleaners or magnetic/static cleaning devices. Prevent moisture getting into the device or the power adapter.

The service life of the device is 2 years.

## ***Wireless Installation Considerations***

The DSL-224 device lets you access your network using a wireless connection from virtually anywhere within the operating range of your wireless network. Keep in mind, however, that the number, thickness and location of walls, ceilings, or other objects that the wireless signals must pass through, may limit the range. Typical ranges vary depending on the types of materials and background RF noise in your home or office. To maximize your wireless range, follow the guidelines below.

1. Keep the number of walls and ceilings between the DSL-224 device and other network devices to a minimum – each wall or ceiling can reduce your wireless network range by 3-90 feet (1-30 meters).
2. Be aware of the direct line between network devices. Place your devices so that the signal travels straight through a wall or ceiling (instead of at an angle) for better reception.
3. Building materials make a difference. A solid metal door or aluminum studs may have a negative effect on your wireless range. Try to position your router, access points, and computers so that the signal passes through drywalls or open doorways. Materials and objects such as glass, steel, metal, walls with insulation, water (fish tanks), mirrors, file cabinets, brick, and concrete will degrade your wireless signal.
4. Keep your router away (at least 3-6 feet or 1-2 meters) from electrical devices or appliances that generate RF noise.
5. If you are using 2.4 GHz cordless phones or X-10 equipment (wireless devices such as ceiling fans, lights, and home security systems), your wireless connection may degrade dramatically or drop completely. Make sure your 2.4 GHz phone base is as far away from your wireless devices as possible. Note, that the base transmits a signal even if the phone is not in use.

## CHAPTER 6. ABBREVIATIONS AND ACRONYMS

|              |                                     |
|--------------|-------------------------------------|
| <b>AC</b>    | Access Category                     |
| <b>AES</b>   | Advanced Encryption Standard        |
| <b>ARP</b>   | Address Resolution Protocol         |
| <b>BSSID</b> | Basic Service Set Identifier        |
| <b>CRC</b>   | Cyclic Redundancy Check             |
| <b>DDNS</b>  | Dynamic Domain Name System          |
| <b>DDoS</b>  | Distributed Denial of Service       |
| <b>DHCP</b>  | Dynamic Host Configuration Protocol |
| <b>DMZ</b>   | DeMilitarized Zone                  |
| <b>DNS</b>   | Domain Name System                  |
| <b>DTIM</b>  | Delivery Traffic Indication Message |
| <b>GMT</b>   | Greenwich Mean Time                 |
| <b>IGD</b>   | Internet Gateway Device             |
| <b>IGMP</b>  | Internet Group Management Protocol  |
| <b>IP</b>    | Internet Protocol                   |
| <b>IPsec</b> | Internet Protocol Security          |
| <b>IPoA</b>  | Internet Protocol over ATM          |
| <b>ISP</b>   | Internet Service Provider           |
| <b>LAN</b>   | Local Area Network                  |
| <b>LLC</b>   | Logical Link Control                |
| <b>LCP</b>   | Link Control Protocol               |
| <b>MAC</b>   | Media Access Control                |
| <b>MTU</b>   | Maximum Transmission Unit           |
| <b>NAT</b>   | Network Address Translation         |
| <b>NTP</b>   | Network Time Protocol               |
| <b>PBC</b>   | Push Button Configuration           |
| <b>PIN</b>   | Personal Identification Number      |

|               |   |
|---------------|---|
| <b>PPPoA</b>  | Point-to-Point Protocol over ATM              |
| <b>PPPoE</b>  | Point-to-point protocol over Ethernet         |
| <b>PSK</b>    | Pre-shared key                                |
| <b>QoS</b>    | Quality of Service                            |
| <b>RADIUS</b> | Remote Authentication in Dial-In User Service |
| <b>RIP</b>    | Routing Information Protocol                  |
| <b>RTS</b>    | Request To Send                               |
| <b>RTSP</b>   | Real Time Streaming Protocol                  |
| <b>SIP</b>    | Session Initiation Protocol                   |
| <b>SSID</b>   | Service Set Identifier                        |
| <b>TKIP</b>   | Temporal Key Integrity Protocol               |
| <b>UPnP</b>   | Universal Plug and Play                       |
| <b>URL</b>    | Uniform Resource Locator                      |
| <b>VC</b>     | Virtual Circuit                               |
| <b>VCI</b>    | Virtual Circuit Identifier                    |
| <b>VLAN</b>   | Virtual Local Area Network                    |
| <b>VPI</b>    | Virtual Path Identifier                       |
| <b>WAN</b>    | Wide Area Network                             |
| <b>WEP</b>    | Wired Equivalent Privacy                      |
| <b>Wi-Fi</b>  | Wireless Fidelity                             |
| <b>WLAN</b>   | Wireless Local Area Network                   |
| <b>WPA</b>    | Wi-Fi Protected Access                        |
| <b>WPS</b>    | Wi-Fi Protected Setup                         |
